সরকারি কর্মচারীগণ জনগণের সেবক

সমস্ত সরকারি কর্মচারীকেই আমি অনুরোধ করি, যাদের অর্থে আমাদের সংসার চলে, তাদের সেবা করুন। যাদের জন্য, যাদের অর্থে আজকে আমরা চলছি, তাদের যাতে কষ্ট না হয়। তার দিকে খেয়াল রাখুন। যারা অন্যায় করবে, আপনারা অবশ্যই তাদের কঠোর হস্তে দমন করবেন। কিন্তু সাবধান, একটা নিরপরাধ লোকের উপরও যেন অত্যাচার না হয়। তাতে আল্লাহর আরশ পর্যন্ত কেঁপে উঠবে। আপনারা সেই দিকে খেয়াল রাখবেন। আপনারা যদি অত্যাচার করেন, শেষ পর্যন্ত আমাকেও আল্লাহর কাছে তার জন্য জবাবদিহি করতে হবে। কারণ, আমি আপনাদের জাতির পিতা, আমি আপনাদের প্রধানমন্ত্রী, আমি আপনাদের নেতা। আমারও সেখানে দায়িত্ব রয়েছে। আপনাদের প্রত্যেকটি কাজের দায়িত্ব শেষ পর্যন্ত আমার ঘাড়ে চাপে, আমার সহকর্মীদের ঘাড়ে চাপে। এজন্য আপনাদের কাছে আমার আবেদন রইল, আমার অনুরোধ রইল, আমার আদেশ রইল, আপনারা মানুষের সেবা করুন। মানুষের সেবার মতো শান্তি দুনিয়ায় আর কিছুতে হয় না। একটি গরিব যদি হাত তুলে আপনাকে দোয়া করে, আল্লাহ সেটা কবুল করে নেন। এর জন্য কোনও দিন যেন গরীব-দুঃখীর ওপর, কোনও দিন যারা অত্যাচার করেনি, তাদের ওপর অত্যাচার না হয়। যদি হয়, আমাদের স্বাধীনতা বৃথা হয়ে যাবে।

জাতির পিতা বঙ্গবন্ধু শেখ মুজিবুর রহমান

FOREWORD

I am very pleased to know that the Management Information System (MIS) unit of Directorate General of Family Planning (DGFP) is going to publish the Annual Report 2019 combining the reports for the period July 2017 to June 2019. This annual report of 2019 contains all the statistical information on the progress and achievements on family planning, maternal, child and adolescent reproductive health services operational under the umbrella of DGFP.

In line with the Fourth Health, Population and Nutrition Sector Program (HPNSP) 2017-2022, the MIS unit has modernized its approach to generate accurate and reliable information on a regular basis. In the previous years, the MIS annual report has been considered as an important document which displays all statistical information regarding family planning program in Bangladesh. The MIS unit also publishes monthly report on family planning, maternal and child health, and adolescent reproductive health services regularly. The information system encompasses different layers of hierarchy in collecting and compiling data. In this report, data is presented at national, division, district and upazila levels which enables the policymakers and program personnel to practise evidence-based decision-making. The data revealed in this report can be used to redesign future program plans.

I appreciate the effort of MIS unit and sincerely hope this report will be helpful for the program personnel to implement and develop family planning, maternal and child health and adolescent reproductive health program in the country.

Despite some delays, compiling and publishing three years' program performance in single report is a unique and commendable task; hence, I am conveying my heartfelt congratulations and appreciation to the personnel involved in publishing the report. At the same time, I am requesting all the stakeholders to use the report for program planning purpose.

Shahan Ara Banu, *ndc*

PREFACE

I am very much delighted to see that the 'Annual Report 2019' of Management Information System (MIS) of Directorate General of Family Planning (DGFP) has been finalized and is going to be published. The annual report incorporates all the statistical information on the progress and achievement of family planning program by district, division and national level. This report consists of service statistics of the subsequent three financial years (2016-2017, 2017-18 and 2018-19). The combined report will bring forward comparative data and time series analysis for the policymakers and is expected to provide more comprehensive and broad information for decision making in the Fourth Health, Population and Nutrition Sector Program (HPNSP) 2017-2022.

The MIS unit has already developed web-based software to collect and compile service statistics from field level since December 2011. Online reporting system has been established at upazila and district level and the scaling-up of e-MIS activities at field level is expected to produce quality, real time data for any level of hierarchy in the near future.

This combined annual report summarizes comprehensive and relevant information on family planning, maternal and child health and adolescent reproductive health services as received from field level workers and facilities working under DGFP. For the first time, an Executive Summary of the report and a new chapter on 'Innovations in Family Planning' have been included in the annual report which informs about the adoption of innovative approaches to address gaps in service delivery. Moreover, stories of 'Best Practices of Family Planning at Field Level' would be a useful source of inspiration and model for others to strengthen and accelerate the current program.

MIS Unit of DGFP is extending its gratitude to the USAID Shukhi Jibon Project, implemented by Pathfinder International and partners for supporting in the development of this report. MIS Unit has collaboratively worked with its development partners including the MEL team of USAID Shukhi Jibon Project who have extended their technical capacity to MIS Unit to produce this report.

Finally, I express my heartiest thanks to the team members of the MIS unit who have spared no pains to prepare this annual report within a very short time. I am also indebted to all the relevant Directors and Line Directors of DGFP for their valuable comments on the report. My heartiest thanks to our previous Director General Quazi A K M Mohiul Islam who has contributed a lot through guidance. I am very glad to convey my heartfelt gratitude to our newly joined Director General of DGFP, Ms. Shahan Ara Banu, *ndc* for her guidance and intelligent contribution.

I cordially request the users of this Annual Report for providing necessary suggestions and feedbacks for further improvement in the subsequent editions/issues.

Manoj Kumar Roy

EXECUTIVE SUMMARY

The Management Information System (MIS) Unit of Directorate General of Family Planning (DGFP) collects performance data on Family Planning (FP), Maternal and Child Health (MCH) and Adolescent Reproductive Health (ARH) Services from outreach workers and service centers from all over the country excluding City Corporations and Municipality areas. It compiles both Government and Non-Government performance data and publishes the national report. This annual report highlights the program performance of 2019 with associating the performances of 2017 and 2018.

Eligible couples

According to the DGFP MIS, the total number eligible couple (ELCO) in the country was found to be 27.4 million in 2019 and the total number of acceptor of modern FP methods was 21.3 million in this year. Between 2017 and 2019, ELCOs increased by 393,023 and method acceptors increased by 176,130. A division-wise comparison shows the largest share of ELCO population in Dhaka, containing 28 percent of ELCOs in 2017 and 2018. In 2019, Dhaka and newly split Mymensingh divisions jointly comprised 28 percent of ELCOs. Eighteen percent of ELCOs comes from Chattogram division. Rajshahi, Rangpur and Khulna divisions—the western region of the country—represent 41 percent of ELCOs together. The concentration of ELCOs was the lowest in Barishal and Sylhet, comprising about six percent each. The division-wise ELCO share remains almost the same from 2017 to 2019.

Client segmentations

The use of FP methods varies by age. The use of methods is highly concentrated among those who are aged between 20 and 40. Overall, the married women aged 20 years or below are least likely to use any FP method compared with other age groups. Implant, injectable and pill users are mostly aged between 20 and 40. As expected, users in older groups (age 30-39 and 40 and older) are more likely to be sterilized than younger ones. Women in their 20's and 40's are less likely to use condom.

The use of FP methods varies by number of children. The use of FP methods was the greatest among the couples who have two children followed by the couples who have three children. These two groups comprised three quarters of all users. Couples without children are least likely to use FP methods. Only four percent of couples without children so reported. There is no change in parity-wise use of FP methods from 2017 to 2019.

Performance of short acting methods

Nationally, the couple year protection (CYP) achievement for three short acting methods against the projection decreased in the last three years. The CYP achievement rate for pill declined from 51 percent in 2017 to 43 percent in 2019, and for condom it declined from 47 to 40 percent during the same period. Injectable performance against the projection is lower than two other short acting methods, and its performance declined too from 31 to 24 percent in the last three years.

At the divisional level, Barishal and Dhaka have been consistent in earning the top position in injectable and condom performance respectively in 2019. Also, Dhaka division was the top performer in pill in 2017 and 2018 while it was Mymensingh in 2019.

At the district level, Dhaka has achieved the top position in condom performance in 2019 among all 64 districts. Injectable distribution was the highest in Bhola district in 2019. Kishoreganj was the top performing districts in pill distribution in 2019.

Performance of long acting and permanent methods

Nationally, implant performance against the projection is much higher compared to other long acting and permanent methods. However, the performance of all those methods does not show any significant improvement over time. The performance of permanent method against the projection slightly increased from 41 to 42 percent in the last three years. For IUD, the rate declined slightly from 66 to 64 percent during the same period. Implant performance rose

from 89 percent in 2017 to 106 percent in 2018, but it dropped substantially to 81 percent in 2019.

At the divisional level, permanent method performance was the highest in Khulna in 2017 and 2018, and in Dhaka in 2019. The IUD performance was the highest in Chattogram division in 2017 and 2019, and in Khulna in 2018. The top performing divisions in implant are Sylhet in 2017, Dhaka in 2018, and Rajshahi in 2019.

At the district level, permanent method performance was the highest in Joypurhat among all 64 districts in 2017, and in the next two years it was in Rajbari. The IUD performance was the highest in Chattogram in 2017, Khulna in 2018, and Rajbari in 2019. In performing Implant, Rajbari secured first position in 2019, Bandarban in 2018 and Cox's Bazar in 2019. Rajbari is the only district in the country which performed best in all long acting and permanent methods in 2019.

Total fertility rate and use of contraception

There has been stagnation in total fertility rate (TFR) since 2011. According to the BDHS 2017, the current TFR is 2.3, the same as in the BDHS 2011. Still, fertility varies by regions. TFR is the highest in Sylhet division (2.6) followed by Chattogram (2.5), both from the eastern region of the country. Since 2011, use of contraception among married women has remained at the same level of 62 percent. Use of contraception is the lowest in the eastern region of the country (CPR in Sylhet: 55%, CPR in Chattogram: 54%). Such regional variations continue to dampen the overall program effectiveness.

Contraceptive acceptance rate (CAR)

The national CAR performance remains almost at the same level (78-79%) in last three years; but there are small differences at the divisional level. During the 2017-19 period, the CAR performance was found to be the highest in Rajshahi (81-82%), closely followed by Khulna and Rangpur divisions. Chattogram division was found to report the lowest CAR in the country (75-76%) during the same period. The CAR gap between top and bottom performing divisions lies between 5-6 percentage points. At the district level, Joypurhat earned the top position in CAR performance (84-85%) in three consecutive years while Feni was found to be the lowest performing district (70-72%) during the same period.

The contraceptive method mix based on CAR remained the same for the period of 2017-19. Pill represents nearly half (49%) of all contraceptive acceptance, followed by injectable (20%). Another 13 percent share comes from permanent method. Of all method acceptance, the share of condom and implant is nine and six percent respectively. The share of IUD is the lowest (3%).

Post-partum family planning

The total number of post-partum family planning (PPFP) method acceptors in 2019 was 1,002,731 which represent almost four percent of ELCOs. The majority adopted pill at post partum, accounting for 53 percent of all PPFP use. Injectable emerges as the second most popular method among PPFP clients (17%), followed by condom (15%). Of all PPFP use, the share of implant and female sterilization is seven and six percent respectively.

Sources of FP methods

Overall, the government sector provides contraceptive methods to more than three quarters of users. In 2019, the highest government sector contribution was observed in implant distribution (89%), followed by IUD (85%), pill (83%), and permanent method (81%). The NGO sector provides contraceptives to less than 20 percent of all users except condom (24%) and injectable (23%). The DGFP MIS also suggests that the NGO sector contribution in long-acting and permanent methods declined over time.

Maternal and child health services

The practice of receiving antenatal care (ANC) is more common than postnatal care (PNC). According to the DGFP MIS, the number of women who made four or more ANC and PNC visits in 2019 was 1,177,813 and 706,375 respectively. More women made four or more ANC and PNC visits in 2018 than in 2017 and 2019.

The deliveries performed at MCHTI, MFSTC, MCWCs, UHCs and UHFWCs increased in the last three years. In 2019, the number of deliveries performed at those facilities was 853,555, of which 54 percent were normal deliveries while 46 percent were C-section deliveries. The share of C-section deliveries of facility-based deliveries increased slightly from 44 to 46 percent between 2017 and 2019.

There has been a gradual decrease in the number of births at home in the last three years. In 2019, the number of births delivered at home was 618,312 compared to 705,884 in 2017. Of all home deliveries, 76 percent were conducted by medically trained providers and 24 percent by untrained providers. The rate of skilled delivery at home remained exactly the same between 2017 and 2019.

Among infant deaths, three quarters of deaths took place in the first 28 days of life after birth (i.e., neonatal death), whereas other one quarter took place in subsequent 11 months (post-neonatal death).

Both infant and maternal deaths were the highest in the eastern region (Sylhet and Chattagram Division) of the country.

Adolescent reproductive health services

Counseling services on ARH by FP workers increased more than two folds in the last three years. The number of adolescents who received counseling on RTI/STI from FP workers was 2,208,010 in 2019 compared to 865,710 in 2017. A gradual increase in the distribution of iron and folic acid (IFA) tablet and sanitary pad among adolescent girls was observed over time. The number of adolescents who received IFA tablet was 1,826,816 in 2019, and sanitary pads was 472,774 in 2018.

Nutritional services

Counseling services by FP workers increased substantially in the last three years. The number of counseling services to mothers on infant and young child feeding (IYCF), IFA, vitamin-A and hand-washing increased more than four times, from 1,686,054 in 2017 to 7,537,839 in 2019. A small increase in the practice of breastfeeding was observed in the last three years and the number of women who reported exclusive breastfeeding was 1,850,674 in 2019. Vitamin-A tablet feeding decreased over time, totaling 517,759 in 2019.

Challenges in FP program

In Bangladesh, family planning remains one of the top priorities in the fourth sector program 2017-2022, as a path toward achieving the Sustainable Development Goals. Several areas require further attention to ensure effective family planning in the future:

- a) **Regional variations in TFR and CPR.** TFR remains the highest and CPR is the lowest in the eastern region of the country.
- b) **Low use of long acting and permanent methods of contraception.** Only nine percent of all eligible couples use a long acting or a permanent method to limit fertility.
- c) **Low use of contraception among young married females.** Use of contraception among young married females age 15-19 is 49 percent which is lower than the national average of 62 percent.
- d) **Low male participation in contraception.** Male contribution in total method use is only eight percent (male sterilization 1%, condom 7%).
- e) **High maternal mortality.** By 2030, Bangladesh is committed to bring down the maternal mortality ratio from 170 to 70 per 100,000 live births. By 2030, the country needs to increase the rate of skilled delivery to 100 percent from 53 percent.
- f) **High child mortality.** By 2030, Bangladesh is committed to reduce under-five deaths to 25 per 1,000 live births from 45. The reduction in neonatal mortality remains a challenge, which accounts for two-thirds of all under-five deaths.

- g) **Data driven challenges:** A routine data quality auditing and sample survey can be adopted to improve the validity and reliability of field data. It is also important to consider demographic trends in projection setting exercise.
- h) **Adolescent Fertility Rate:** Higher adolescent fertility is a major challenge of the program. Married women aged 20 years or below are least likely to use any FP method compared with other age groups. Special focus should be given to the couple of adolescent age.
- i) **Contraceptive Dropout:** Thirty-seven percent of users of a contraceptive method stop using the method within 12 months of starting (BDHS 2017). As expected, discontinuation rates are much higher for temporary methods like condoms (45%), pills (42%), and injectables (34%) than for long-term methods like implants (11%). It is important to address the issue of contraceptive discontinuation.
- j) **Unmet Need of Contraceptives:** Young married women (less than 20 years of age) deserve special consideration because unmet need is the highest among them, and their fertility is high. The programme should attach high priority to addressing the needs of these women by appropriate IEC measures and selective home visits.

I. INTRODUCTION

Bangladesh is now Asia's fifth and the world's eighth most populous country with an estimated population of 164.6 million in 2018 (SVRS 2018). It has experienced a dramatic decline in fertility during last four decades which can be attributed to its success in family planning program. The country has experienced a demographic transition where the age structure has gone through profound changes. The annual population growth rate has declined from 2.32 percent in 1981 to 1.37 in 2017 which leads to a small increase in population in the coming decades. According to the World Population Prospects (The 2017 revision), the population of Bangladesh is expected to grow by another 40 million and will be stabilized at 202.9 million in 2057.

Bangladesh is one of the exceptional experiences in the world which have demonstrated that fertility decline is possible, even in the absence of rapid economic development and social change. The comprehensive family planning program with massive and sustained efforts over time largely contributed to this achievement. The family planning program in Bangladesh was first introduced in the early 1950s through voluntary effort and the government program was introduced in 1965.

The Family Planning Program in Bangladesh has evolved through a series of developmental phases and undergone through changes in strategy, structure, content and goals. The government deployed Family Welfare Assistants (FWAs) at the community level, initiated Social Marketing Program to promote contraceptives and involved a number of NGOs to provide client-centered reproductive and child health and family planning services.

The Bangladesh Population Policy 2012 has the vision to develop healthy, happy and prosperous Bangladesh through planned development and control of population. The population policy aims to attain replacement level fertility by 2015 and emphasizes to ensure family planning (FP), adolescent reproductive health (ARH), safe motherhood and child health services. In line with the policies and the Fourth Health, Population and Nutrition Sector Program (HPNSP) 2017-2022, the Directorate General of Family Planning (DGFP) is promoting family planning, maternal and child health (MCH), and ARH services in order to reach Sustainable Development Goals (SDGs) as well as to increase the Contraceptive Prevalence Rate (CPR) to 75 percent, reduce the Total Fertility Rate (TFR) to 2.0, and reduce unmet need for family planning to 6 percent by 2022.

The Management Information System (MIS) is one of the major program management components of DGFP which supports monitoring the progress of program implementation at various levels. The present system inherited the performance statistics review process of mid-seventies. The performance statistics were usually collected from the field functionaries and reported to the central office routinely. The system of data collection was considered to be a normal routine work by the government offices. The information collected from the field was hardly used as the basis of planning and management of program operation in the field. A structured MIS replaced the conventional system and has become the strongest management tool of the program managers. Program data collected at different levels are processed into usable information through manual or electronic methods. The processed information are then analyzed and interpreted into actionable measures and sent down the line to the field managers and through them to the field functionaries and outreach service centers. This 'feedback' mechanism serves as a strong management tool for the local level managers as the different units and individuals are ranked and evaluated according to their status of performance. The feedback messages are communicated to the performers for taking corrective measures for better performance.

The MIS unit of DGFP is responsible for the collection, compilation, processing and analysis of monthly FP, MCH and ARH related data as well as documenting yearly population and number of eligible couples all over the country excluding City Corporations. The MIS unit generally publishes an annual report through using its web-site which is used as a platform to collect and compile data from field level.

II. Historical Perspective of Family Planning Program

Bangladesh Family Planning Program evolved through a series of development phases that took place during the last 60 years. Family planning efforts in this country began in the early 1950s with voluntary efforts of a group of social and medical workers. At 1965 FP program was first initiated by the government as a clinic based program. After that the Family Planning Program in Bangladesh has undergone a number of transitional phases. The phases may be illustrated as follows:

Phase I (1953-59): Voluntary Family Planning efforts

Phase II (1960-64): Government sponsored clinic-based Family Planning Program

Phase III (1965-70): Field-based Government Family Planning Program

Phase IV (1972-74): Integrated Health & Family Planning Program
 Phase V (1975-80): Maternal and Child Health (MCH)-based Multi-Sectoral Program
 Phase VI (1980-85): Functionally Integrated Program
 Phase VII (1985-90): Intensive Family Planning Program
 Phase VIII (1990-98): Reduction of rapid growth of population through intensive service delivery and community participation and preparation of HPSP
 Phase IX (1998-2003): Health and Population Sector Program (HPSP)
 Phase X (2003-2011): Health, Nutrition and Population Sector Program (HNPSPP)
 Phase XI (2011-2016): Health, Population and Nutrition Sector Development Program (HPNSDP)
 Phase XII (2017-2022): Fourth Health, Population and Nutrition Sector Program (4th HPNSP)

Priority Interventions

- Promoting delay in marriage and childbearing, use of post-partum FP, post MR/PAC FP and FP for appropriate segments of the population.
- Strengthening FP awareness building efforts through mass communication and IEC activities and considering local specificities.
- Using different service delivery approaches for different geographical regions and segments of the population.
- Maintaining focus on commodity security and ensuring uninterrupted availability of quality FP services closer to the people (at the CC level).
- Registering eligible couples with emphasis on urban areas to establish effective communication and counseling.
- Compensating for lost wages (reimbursement for opportunity costs) for long acting and permanent method performance.
- Strengthening FP services especially post-partum and post MR/PAC FP and demand generation through effective coordination of services with DGHS utilizing appropriate opportunities.
- To provide safe delivery at homes and facilities
- To educate adolescent boys and girls on healthy reproductive lifestyle practices
- To ensure healthy life of man and women throughout the whole period of reproductive life.
- To educate community people on nutrition.
- To train service providers to ensure quality of services
- To maintain MSR / Logistic supplies to the service centers
- To repair and renovate of service centers
- To introduce evidence based best practices in the program, such as introduction of tab. Misoprostol.
- To monitor and supervise for ensuring quality of care
- To ensure safe MR and Post Abortion Care(PAC) in health care centers

HPNSP priority indicators with benchmarks and targets

Indicator	BDHS 2014	BMMS 2010	BDHS 2017	WHO 2015	HPNSP Target June 2022
Under-5 Mortality Rate (per 1,000 live births)	46		45		34
Neonatal Mortality Rate (per 1,000 live births)	28		30		18
Maternal Mortality Ratio (per 100,000 live births)		194		169	121
Total Fertility Rate	2.3		2.3		2.0
Trends in maternal health					
a) ANC at least 4 visits	a) 31.2%		a) 47%		50%
b) Delivery attended by a medically trained provider	b) 42.1%		b) 52.7%		65%
Contraceptive Prevalence Rate	62.4%		61.9%		75%

III. FAMILY PLANNING SERVICE APPROACHES

The FP service centers are available across the country in order to ensure quality FP services to the people. A wide range of service outlets have been established at several levels of hierarchy throughout the country.

A. National level institutions and service outlets

Maternal and Child Health Training Institute (MCHTI), Azimpur, Dhaka

Mohammadpur Fertility Service and Training Center (MFSTC), Mohammadpur, Dhaka

Eight FP Model Clinics attached to

- Dhaka Medical College Hospital
- Sir Salimullah Medical College Hospital
- Mymensingh Medical College Hospital
- Chattogram Medical College Hospital
- Rajshahi Medical College Hospital
- Rangpur Medical College Hospital
- Sylhet Medical College Hospital
- Barishal Medical College Hospital

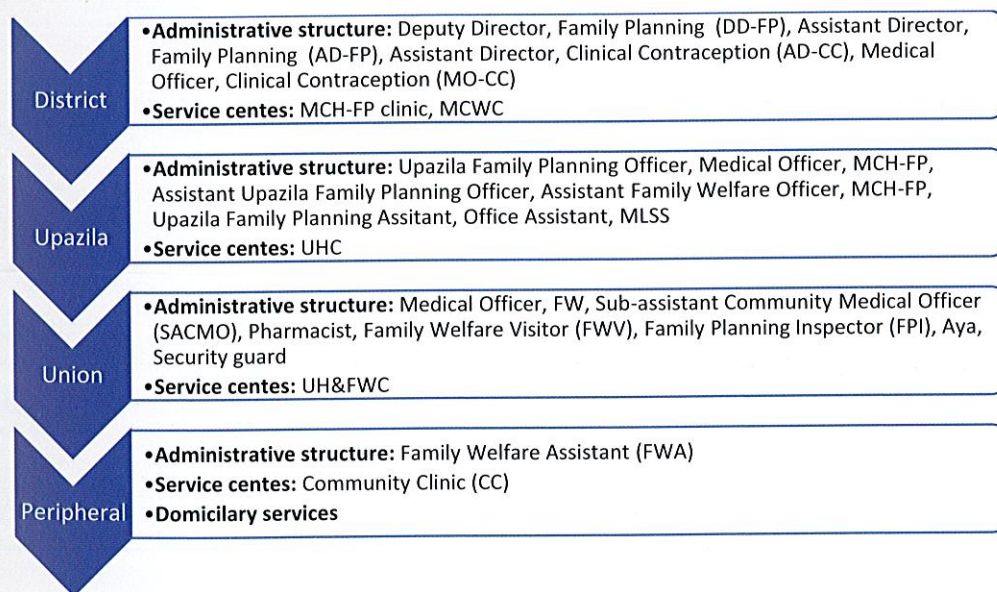

Maternal and Child Health Training Institute (MCHTI) Lalkuthi, Mirpur, Dhaka

Family Welfare Visitors Training Institute (FWVTI), Dhaka

Mohanagar Satalite Clinic, Bashabo, Dhaka

NGO clinics affiliated with DGFP at national, district and upazila levels: 205

B. Field level service centers and personnel

IV. INNOVATIONS IN FAMILY PLANNING

Recently, the government has taken several steps and created platforms for the promotion of 'Innovation' and 'Service Process Simplification' among government officials. In this regard, the Medical Education and Family Welfare Division under the Ministry of Health and Family Welfare (MOHFW) in collaboration with Cabinet Division and a2i Program jointly was organizing a workshop named as 'Innovation for Citizen Service' for evaluating, showcasing and sharing of innovative approaches since 2017. In the workshop, a number of DGFP personnel from field-level family planning offices presented innovative approaches in service delivery. After the event, the DGFP started to arrange 'Innovation Showcasing Program' every year.

Innovation showcasing and evaluation

Phase I

In the first phase of evaluating, showcasing of pilot projects, two innovative approaches were selected for replication at field level. The two approaches are:

- 1) Increasing institutional delivery and reducing drop-outs of oral pills at Kustia Sadar Upazila
- 2) Creating depo-corner and voice SMS through mobile for reducing drop-outs of FP methods and increasing ANC and PNC services

Phase II

Under the MOHFW, the Medical Education and Family Welfare Division in collaboration with Cabinet Division and a2i Program jointly organized an 'Innovation Showcasing' workshop on 15 May 2019. In the event, 15 DGFP personnel participated and presented their innovative approaches and from them, six innovative approaches were selected for replication at regional level and one for scaling-up to the entire country. Other remaining approaches were marked/shelved for further piloting.

a) Scaling-up of an innovative approach at national level

Serial No.	Innovative Activity	Implementation Agency/Officer
1.	e-MIS activities for providing family planning, maternal and child health service	MIS unit of DGFP in collaboration with development partner (USAID)

b) Approaches undertaken for replication at regional level: Six innovations

Serial No.	Innovative Activity	Implementation Agency/Officer
1	Monitoring software for ensuring safe motherhood and reducing maternal and child mortality	District Family Planning Office, Chadpur
2	Smart MCH service management software	Mohammed Abdur Rahim Upazila Family Planning Officer, Kapasia, Gazipur
3	Family welfare mother's club	Iftekhar Ahmed Chowdhury, Upazila Family Planning Officer, Sadar, Feni
4	Mother gathering	Bidhan Kanti Rudra Upazila Family Planning Officer Kutubdia, Cox'sbazar
5	Dissemination of knowledge on adolescent health at high schools (Grades 6 to 10)	Sabiha Kabir Upazila Family Planning Officer Sadar, Panchagarh
6	Providing gift box (equipped with FP methods and information) to newly married couple to delay pregnancy	Field Service Delivery Unit Directorate General of Family Planning

V. MANAGEMENT INFORMATION SYSTEM IN FAMILY PLANNING

The MIS unit of DGFP began functioning in mid-seventies. In 1979, the MIS unit was created from the Research, Evaluation, Statistics and Planning (RESP) activities under DGFP. Since then, there have been improvements in the functions in the unit to establish a regular system of data collection and reporting on national program performance of family planning. It is a system of collecting, recording, processing, analyzing and disseminating program-related information which helps to take informed decisions. In reality MIS is a performance monitoring system to maximize service delivery. The key objective of MIS is to improve and strengthen national capacity to plan, formulate, monitor and evaluate the progress of family planning, MCH and ARH services in a more systematic way through effective recording, reporting, data management and analysis.

Information regarding program performance on FP, MCH and ARH can be gathered from MIS. The MIS functions as the central data repository on national FP program performance in the entire country. It plays vital role in management and decision making. It also shares information at different levels of program management. The MIS unit introduced innovative approaches in the field to strengthen and institutionalize data collection, storage and transmission to the MIS headquarters for publication of analytical reports for dissemination to different national and international stakeholders. Notable among the steps to strengthen reliable data gathering are: (i) delegation of national FP-MCH projection to different upazilas, (ii) introduction of a longitudinal data collection mechanism through FWA register, (iii) a variety of modernized clinic registers and reporting formats, (iv) periodic couple registration, and (v) comprehensive monitoring by MIS personnel and performance checking in high and low performing areas.

MIS collects performance data on FP, MCRAH & LAPM data from outreach workers and service centers from all over the country excluding major parts of City Corporation and Municipality Areas. It compiles service performances from both Government and Non-Government Organization working in this field and publishes the national report. Service Statistics in MIS are prepared both in FP methods distribution, methods acceptance and information on MCRAH services. It prepares the aggregate monthly report in terms of national, divisional, district and upazila level performances. Most of the City Corporation and Municipal area are excluded from that report as the Local Government Authorities are mainly responsible to provide family planning services in these areas.

The FP program personnel at various levels are the key functionaries of MIS. Training for MIS implementation and data quality check are two major components of MIS for generating high quality data. Recently, Family Welfare Assistants (FWAs), Family Planning Inspectors (FPIs) and Family Welfare Visitors (FWVs) have been provided training on FWA register and related forms to modernize and improve the collection of data for valid recording and reporting. In addition, strong supervision and systematic quality checks are applied to maintain the correctness and reliability of data.

All upazila, district and divisional family planning offices have been provided with computers and internal connectivity under single digital network for web-based data management for better program monitoring. In December 2011, the MIS unit has introduced web-based software to collect service statistics data from field level. Data entered at district FP offices are directly sent to web server, and the MIS unit processes the data to prepare monthly FP, MCH and ARH report. In January 2014, using best practices of district level data input and retrieving system, web-based data entry has been started at upazila family planning offices.

Recent developments in MIS unit

Electronic Management Information System (eMIS)

The electronic Management Information System (eMIS) facilitates enterprise-wise automation. It seamlessly connects community workers and providers at first line facilities with their supervisors and managers through mobile applications in a cloud-based environment. Based on DGFP's population database, lists are generated for providing services to the clients (FP, MCH, general patients etc). Software tools are used to collect essential data and users are supported by in-app alerts and reminders. Web-based tools are available for month-end reporting and other management tasks. The e-MIS system was first piloted in two districts in 2015; then DGFP started scaling up in 2018 and currently eMIS is operational in 30 out of 64 districts in Bangladesh.

Key features of monitoring and administrative tools:

- Web-based mentoring tools are available for supervisors and managers at the district and upazila level as well as decision-makers at central level. It also attends to the need of system management functions.
- The tools produce real time data which the supervisors and managers can use to monitor the performance of the field-level workers.
- There are tools for monitoring population registration, registration of eligible couples, pregnant women with status of scheduled visits, ANC and PNC services, and attainment of tasks mentioned in the work plan.

DHIS2 for MIS of DGFP

DHIS2 is a software tool for collection, validation, analysis and presentation of aggregate and client-based statistical data, tailored (but not limited) to integrate health information management activities. It is a generic tool rather than a pre-figured database application with an open meta-model and a flexible user interface that allows the user to design the content of a specific information system without the need for programming. The database allows entry of data at source and creation of dashboards, summary tables, charts and GIS locations instantly for any level of hierarchy. Several countries around the world have adopted DHIS2 as their nation-wide HIS software, including Bangladesh, Kenya, Ghana, Uganda, and Rwanda.

The purpose of DHIS2 can be summarized as follows:

- Offer customization and local adaptation through the user interface. No programming required to start using DHIS2 in a new setting (country, region, district etc)
- Provide data entry tools which can either be in the form of standard lists or tables or can be customized to replicate paper forms
- Provide a variety of customized tools for validation of data and improvement of data quality
- Provide easy to use one-click reports with charts and tables for selected indicators or summary reports

VI. FAMILY PLANNING PROGRAM PERFORMANCE, 2019

Eligible Couples

In 2019, Bangladesh had a population of 163 million.¹ The country adds approximately 1.7 million people every year. According to the DGFP MIS, the total number eligible couple (ELCOs) in the country was found to be 26.96 million in 2017 which increased to 27.36 million in 2019.² The increase in total number of eligible couples has not been consistent in the last three years. The increase in ELCOs was greater in 2018 and the increase slowed in 2019 (Table 1).

In 2017, the total number acceptor of seven modern methods of contraception in the country was found to be 21.17 million among 26.96 million ELCOs. The number of method acceptors increased in 2018 while it decreased in 2019. The increase in total number of method acceptors during the reference period is smaller in comparison to the corresponding increase in ELCOs. The total number of ELCOs increased by 393,023 while the total number of method acceptors increased by 176,130.

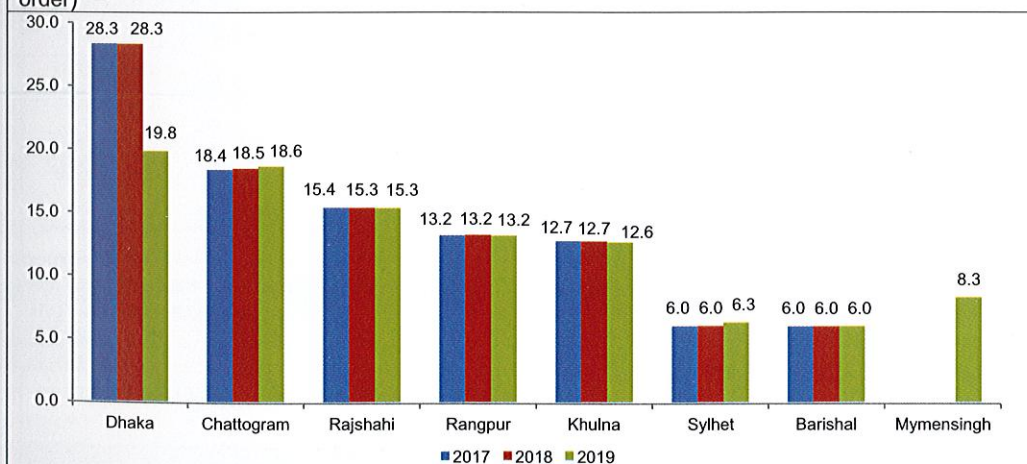

Table 1: Total population, eligible couples and method acceptors, Bangladesh, 2017-2019

Indicator	2017	2018	2019
Total population	159,685,421	161,376,713	163,046,173
Total eligible couples	26,964,010	27,288,505	27,357,033
Total method of acceptors	21,164,934	21,588,306	21,341,064

Administratively, Bangladesh has recently been divided into eight divisions as Dhaka division was split into two by namely, Dhaka and Mymensingh. Earlier the country had seven administrative divisions. In this report, the 2017 and 2018 analysis focused on seven divisions while 2019 analysis is based on eight divisions. Rajshahi, Rangpur and Khulna divisions are located in the western region of the country while Chattogram and Sylhet constitute the eastern region of the country and the remaining divisions (Dhaka, Mymensingh and Barishal) lie in the middle region.

A division-wise comparison shows the largest share of ELCO population in Dhaka, containing 28 percent of ELCOs in 2017 and 2018. In 2019, Dhaka and newly split Mymensingh jointly comprised 28 percent of ELCOs. Eighteen percent ELCOs comes from Chattogram division, which remains almost the same over the period. Rajshahi, Rangpur and Khulna divisions—the western region of the

Figure 1: Percent distribution of eligible couples by divisions, Bangladesh, 2017-2019 (Descending order)

Note: Mymensingh split from Dhaka division.

country—represent 41 percent of ELCOs together and their share remains the same over time. The concentration of ELCOs is lowest in Barishal and Sylhet, comprising about six percent each (Figure 1).

¹ UN. 2019. *World Population Prospects 2019*. New York: Population Division, United Nations.

² Currently, FP fieldworkers collect information on the use of seven modern FP methods from 27 million married women of reproductive age across the entire country except city corporations and municipal areas. Contraceptive use of married women from big cities is not reflected in CAR estimates though the patterns between urban and rural women do not differ much in terms of FP use and method mix.

As expected, the highest number method acceptors comes from Dhaka division (which contains largest number of ELOCs), with 5.94 million in 2017 and 6.06 million 2018. The total number method acceptors in Chattogram were found to be 3.74 million in 2017, which increased to 3.82 million in 2019. The concentration of method acceptors is lowest in Barishal closely followed by Sylhet, with 1.29 million and 1.34 million respectively in 2019 (Table 2).

Of all ELOCs, 79 percent accepted any FP methods in 2017, and the rate does not vary notably in the next two years. However, the rate of method acceptors varies by regions. There is clear east-west gap in the method acceptance. The proportion of eligible couples who have accepted any methods is the highest in the western region— Rajshahi division reported 81 percent, followed by Khulna and Rangpur division. The proportion of eligible couples who have accepted any methods is the lowest in Chattogram (75-76%). Both the pattern and intensity in regional variations remain almost the same in the past three years (Table 2).

Table 2: Method acceptors by divisions, Bangladesh, 2017-2019 (Descending order)

2017			2018			2019		
Division	Method acceptors	CAR %	Division	Method acceptors	CAR %	Division	Method acceptors	CAR%
Rajshahi	3,357,243	81.1	Rajshahi	3,416,550	81.60	Rajshahi	3,389,976	81.0
Khulna	2,749,193	80.0	Khulna	2,787,110	80.50	Khulna	2,742,906	79.4
Rangpur	2,830,670	79.6	Rangpur	2,876,830	79.90	Rangpur	2,853,225	79.3
Barishal	1,271,406	78.4	Sylhet	1,308,861	79.40	Mymensingh	1,780,012	78.8
Sylhet	1,274,093	78.3	Barishal	1,292,510	79.10	Barishal	1,286,441	78.5
Dhaka	5,938,204	77.8	Dhaka	6,058,239	78.50	Sylhet	1,338,548	77.7
Chattogram	3,744,125	75.7	Chattogram	3,848,206	76.40	Dhaka	4,134,402	76.4
						Chattogram	3,815,554	75.0
National	21,164,934	78.5	National	21,588,306	79.10	National	21,341,064	78.0

Client segmentations

The DGFP operates a nationwide household data collection. It helps to estimate the projections, performances and client segmentations. FWAs collect this information during January-February every year. They take history from the married women of reproductive age from every household about the family planning methods the married couples used in the previous year. The data on method acceptors disaggregated by age group is presented in Tables 3-5.

The use of FP methods varies by age. The use of methods is highly concentrated among those who are aged between 20 and 40. Overall, the married women aged 20 years or below are least likely to use any FP method compared with other age groups. Implant, injectable and oral pill users are mostly aged between 20 and 40. As expected, users in older groups (age 30-39 and 40 and older) are more likely to be sterilized than younger ones.

- Implant was the most popular among users age 20-29 compared with other age groups. Among implant users, more than three quarters was concentrated among those who are aged between 20 and 40 during the reference period. The use of implant by age is consistent across time, and it reaches a peak of 40-43 percent among women age 20-29, followed closely by women age 30-39.

Table 3: Percent distribution of users of methods by age, Bangladesh 2017

Method	Age				Total
	<20	20-29	30-39	40 or older	
Permanent method	10.2	40.8	34.4	14.6	100.0
IUD	18.0	39.3	29.3	13.4	100.0
Implant	8.5	40.2	36.4	14.9	100.0
Injectable	6.5	36.3	39.6	17.5	100.0
Oral pill	9.1	43.3	35.5	12.1	100.0
Condom	0.8	17.2	44.5	37.5	100.0

Table 4: Percent distribution of users of methods by age, Bangladesh 2018

Method	Age				Total
	<20	20-29	30-39	40 or older	
Permanent method	0.8	17.6	44.6	36.9	100.0
IUD	6.5	36.6	39.2	17.6	100.0
Implant	9.7	43.4	34.9	11.9	100.0
Injectable	11.4	47.1	30.8	10.8	100.0
Oral pill	10.3	40.9	34.3	14.7	100.0
Condom	18.4	39.0	29.2	13.4	100.0

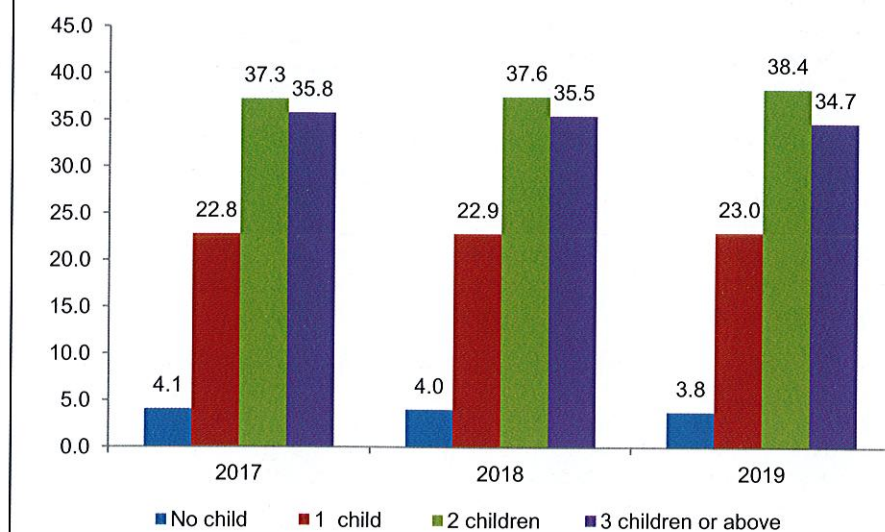

- Similarly, oral pill is the most widely used method among those who are aged between 20 and 40. The use of pill reaches a peak of 40-43 percent among women age 20-29, followed closely by women age 30-39.
- Women in their 20's are least likely to use condom. The use of condom by age is not consistent over time in 2017. Interestingly, condom use was unusually higher (38%) among older age group in 2017. In contrast, condom use among young users was negligible (<1%) in that year.
- In 2017, injectable users were largely concentrated among 30-39-year-olds (40%) and in the next two years it shifted towards 20-29-year-olds.
- In 2018 and 2019, eligible couples who took permanent method were mostly between 30 and 39 years (45%). In 2017, permanent method use was unusually higher among 20-29-year-olds (41%).
- Among IUD users, three quarters are aged between 20 and 40 during the reference period.

Table 5: Percent distribution of users of methods by age, Bangladesh 2019

Method	Age				Total
	<20	20-29	30-39	40 or older	
PM	0.8	15.9	44.6	38.7	100.0
IUD	5.8	35.1	40.2	18.9	100.0
Implant	8.9	42.1	36.4	12.6	100.0
Injectable	8.2	39.1	37.2	15.4	100.0
Oral pill	9.6	40.0	35.3	15.2	100.0
Condom	16.8	38.8	30.7	13.7	100.0

The use of FP methods is the greatest among the eligible couples who have two children, accounting for 37-38 percent of all users. The rate is slightly lower at 35-36 percent among the eligible couples who have three children. These two groups comprised three quarters of all users. Couples without children are least likely to use FP methods.

Figure 2: Percent distribution of FP users by number of children, Bangladesh, 2017-2019

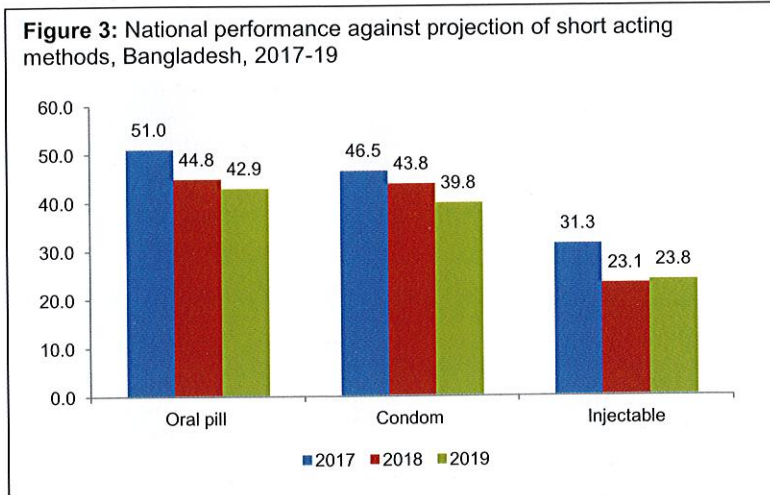

Only 4 percent of couples without children so reported. Overall, the variance in the use of FP methods by children is consistent over time (Figure 2).

Performance of short acting contraceptive methods

National performance

Nationally, the couple year protection (CYP) achievement for three short acting methods did not exceed 51 percent against the projection in the last three years. Among short acting methods, pill performance is better than other two methods in terms of CYP achievement. However, there has been a decline in the CYP achievement for all three short acting methods. The rate is continuously declining for condom and pill. At present, the CYP achievement for pill is 43 percent followed by condom at 40 percent. The CYP achievement rate for injectable is the lowest among three short acting methods, accounting for 24 percent. In the last three years, pill performance decreased by 8 percentage points, and injectable and condom by 7 percentage points each.

Divisional performance

Division-wise yearly achievement rates of pill, injectable and condom against the projection for the period of 2017-19 are shown in Tables 6-8.

In 2017, Barishal division earned the top position in injectable performance with an achievement rate of 86 percent against the projection. In contrast, this division is a low achiever in pill and condom which is reflected in its second lowest position with 53 and 32 percent respectively. In the same year, Dhaka division achieved the highest performance in pill (77%) and condom (62%) against the projection. Rangpur was the second highest performing division in injectable and pill with achievement rate of 73 and 72 percent respectively while this division is ranked the lowest with an achievement rate of 31 percent in condom. Sylhet division was ranked the second position in condom performance.

There is a notable difference between the highest and the lowest CYP achievement rate for each method. The gap in injectable performance between top and bottom placed divisions is 35 percentage points, while for pill and condom the gap is about 30 percentage points (Table 6).

Table 6: Division-wise achievement rate of short acting methods, Bangladesh, 2017 (Descending order)

Rank	Division	Injectable (in CYP) Achievement rate (%)	Division	Oral pill (in CYP) Achievement rate (%)	Division	Condom (in CYP) Achievement rate (%)
1	Barishal	85.8	Dhaka	76.5	Dhaka	62.0
2	Rangpur	73.0	Rangpur	71.5	Sylhet	57.1
3	Chattogram	63.6	Sylhet	59.4	Rajshahi	54.8
4	Khulna	61.9	Khulna	59.3	Khulna	52.5
5	Dhaka	59.6	Rajshahi	59.2	Chattogram	43.9
6	Sylhet	52.6	Barishal	53.4	Barishal	31.6
7	Rajshahi	51.0	Chattogram	46.5	Rangpur	31.3
	National	62.2	National	63.0	National	50.2

In 2018, Barishal division distributed the highest number of injectable with the achievement rate of 78 percent followed by Rangpur division at 61 percent. Dhaka division outperformed all other divisions in pill (67%) and condom (46%) distribution while Rangpur earned the second position in pill distribution (61%) and Khulna reported the same for condom distribution (45%). Overall, the 2018 injectable performance reveals 34 percentage points gap between the highest and the lowest

performing divisions. The difference between top and bottom performing divisions for pill and condom was 22 and 23 percentage points respectively (Table 7).

Table 7: Division-wise achievement rate of short acting methods, Bangladesh, 2018 (Descending order)

Rank	Division	Injectable (in CYP)		Oral pill (in CYP)		Condom (in CYP)	
		Achievement rate (%)	Division	Achievement rate (%)	Division	Achievement rate (%)	Division
1	Barishal	78.1	Dhaka	66.5	Dhaka	45.9	
2	Rangpur	60.7	Rangpur	60.8	Khulna	45.2	
3	Khulna	55.1	Rajshahi	54.8	Rajshahi	41.8	
4	Chattogram	54.5	Sylhet	54.7	Sylhet	39.4	
5	Dhaka	52.7	Khulna	51.0	Chattogram	33.1	
6	Sylhet	48.0	Barishal	51.0	Barishal	28.6	
7	Rajshahi	44.8	Chattogram	43.8	Rangpur	23.1	
	National	54.4	National	56.1	National	38.4	

In 2019, Barishal division achieved the highest performance in injectable followed by Rangpur division (78% and 63% respectively). Oral pill distribution was the highest in Mymensingh division closely followed by Dhaka division (62% and 60% respectively). Dhaka division distributed the highest number of condom in the same year and Sylhet division was the next (61% and 46% respectively).

The gap between top and bottom performing divisions continues to be substantial and the intensity varies by methods. In 2019, the largest top-bottom gap is observed for condom at 37 percentage points, followed by the gap for injectable at 35 percentage points and then for pill at 22 percentage points (Table 8).

Table 8: Division-wise achievement rate of short acting methods, Bangladesh, 2019 (Descending order)

Rank	Division	Injectable (In CYP)		Oral pill (In CYP)		Condom (In CYP)			
		Achievement (%)	rate	Division	Achievement (%)	rate	Division	Achievement (%)	rate
1	Barishal	78.0		Mymensingh	62.3		Dhaka	61.1	
2	Rangpur	63.1		Dhaka	60.2		Sylhet	45.7	
3	Chattogram	53.3		Rangpur	52.2		Rajshahi	44.5	
4	Dhaka	53.2		Rajshahi	51.3		Khulna	42.2

6	Sylhet	48.1		Barishal	48.7		Chattogram	35.6	
7	Mymensingh	46.2		Khulna	46.0		Barishal	26.3	
8	Rajshahi	42.9		Chattogram	39.8		Rangpur	23.8	
	National	53.4		National	51.1		National	37.6	

In three consecutive years, Barishal division has been consistent in earning the top position in injectable performance accompanied by Rangpur division which earned the second position. Dhaka division achieved the highest performance in condom performance in three consecutive years and was the top performer in pill in two out of three years.

District performance

Figure 4 shows the top performer among all 64 districts in terms of distribution of specific short acting method against projection.

Injectable distribution was the highest in Bhola district in 2017 and after one year it earned the top position again. Bhola exceeded the projection target in both occasions (147% in 2017 and 136% in 2019). In between, injectable distribution was the highest in Barishal district in 2018.

Oral pill performance data reveals three different districts topping in three years. In 2017, the top performing district in pill distribution was Mymensingh. Next year Dhaka achieved the highest performance in pill. In 2019, pill performance was the highest in Kishoreganj.

Dhaka has been consistent in securing the top position in condom performance in three consecutive years among all 64 districts, and it exceeded the projection target of 100 percent in 2017 and 2019.

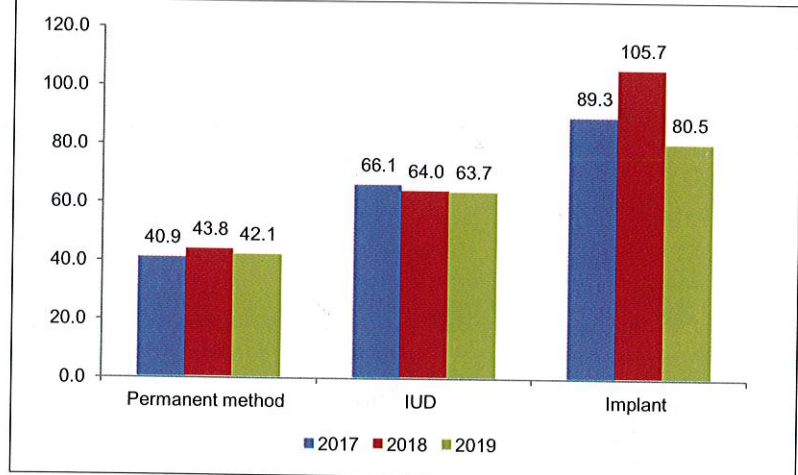

Performance of long acting contraceptives and permanent methods

National performance

Analysis of last three years' performance of long acting and permanent methods of contraception does not show any significant improvement (Figure 5). Among long acting and permanent methods, implant performance is much higher than other two methods in terms of CYP achievement rate. The CYP achievement rate for permanent method remained almost at the same level (41-44%) over the three-year period. For IUD, the rate declined slightly from 66 percent in 2017 to 64 percent in 2018, and sustained in the following year. Implant performance rose from 89 percent in 2017 to 106 percent in 2018, but it decreased substantially to 81 percent in 2019.

Figure 5: National performance against projection of clinical methods in Bangladesh, 2017-19

Divisional performance

Annual achievement rates of divisions against the projection of permanent method, IUD and implant for the period of 2017-19 are shown in Tables 9-11.

In the year 2017, Khulna division was found to be the top performer in permanent method closely followed by Dhaka division with the achievement rate of 48 and 46 percent respectively. The IUD performance was the highest in Chattagram division (76%) closely followed by Barishal division.

Implant distribution was the highest in Sylhet division while Rangpur division earned the second position with the achievement rate of 106 and 96 percent respectively against the projection.

The gap between top and bottom performing divisions in the performance of long acting and permanent methods is large and it varies by methods. In 2017, the top-bottom gap was the largest for implant at 26 percentage points, followed by IUD at 21 percentage points and permanent method at 18 percentage points (Table 9).

Table 9: Division-wise achievement rate of long acting and permanent methods, Bangladesh, 2017 (Descending order)

Rank	Permanent method		IUD		Implant	
	Division	Achievement rate (%)	Division	Achievement rate (%)	Division	Achievement rate (%)
1	Khulna	47.6	Chattogram	76.3	Sylhet	105.8
2	Dhaka	46.4	Barishal	75.8	Rangpur	95.9
3	Rangpur	45.2	Dhaka	66.8	Dhaka	92.1
4	Rajshahi	38.6	Khulna	61.7	Chattogram	89.6
5	Sylhet	37.0	Rangpur	60.8	Barishal	89.4
6	Barishal	34.4	Rajshahi	60.2	Khulna	80.2
7	Chattogram	30.1	Sylhet	54.7	Rajshahi	79.8
	National	40.9	National	66.1	National	89.3

In 2018, Khulna was the top performing division in both permanent method and IUD with the achievement rate of 55 and 71 percent against the projection respectively. Rajshahi division was ranked the second position in both permanent method and IUD performance. The difference between Khulna and Rajshahi divisions in IUD performance is less than one percent. In the same year, Dhaka division performed the best in implant followed by Rangpur division, with the achievement rate of 130 and 120 percent respectively.

The 2018 implant performance comparison reveals a gap of 49 percentage points between top and bottom division. The next largest difference is observed for permanent method at 23 percentage points while it is the lowest for IUD at 18 percentage points (Table 10).

Table 10: Division-wise achievement rate of long acting and permanent methods, Bangladesh, 2018 (Descending order)

Rank	Permanent method		IUD		Implant	
	Division	Achievement rate (%)	Division	Achievement rate (%)	Division	Achievement rate (%)
1	Khulna	55.2	Khulna	71.4	Dhaka	130.1
2	Rajshahi	50.4	Rajshahi	70.8	Rangpur	119.5
3	Dhaka	48.1	Barishal	65.6	Rajshahi	102.4
4	Rangpur	44.7	Chattogram	65.6	Chattogram	95.8
5	Sylhet	34.7	Dhaka	62.0	Sylhet	90.8
6	Chattogram	34.6	Rangpur	59.0	Khulna	86.2
7	Barishal	32.2	Sylhet	53.4	Barishal	81.3
	National	43.8	National	64.0	National	105.7

In 2019, Dhaka division earned the top position in permanent method performance followed by Rajshahi division. The difference between two divisions in permanent method performance is less than two percent. IUD distribution was the highest in Chattogram division closely followed by Dhaka division with the achievement rate of 77 and 75 percent respectively. Rajshahi division distributed the highest number of implant followed by Dhaka division with achievement rate of 204 and 186 percent respectively.

The 2019 implant performance reveals a highly unusual difference of 191 percentage points between top and bottom divisions. The top-bottom gaps for IUD and permanent method were 30 and 26 percentage points respectively.

Table 11: Division-wise achievement rate of long acting and permanent methods, Bangladesh, 2019 (Descending order)

Rank	Permanent method		IUD		Implant	
	Division	Achievement rate (%)	Division	Achievement rate (%)	Division	Achievement rate (%)
1	Dhaka	49.2	Chattogram	76.6	Rajshahi	204.3
2	Rajshahi	47.8	Dhaka	75.2	Dhaka	185.9
3	Khulna	47.2	Khulna	66.3	Chattogram	119.6
4	Chattogram	41.6	Barishal	57.4	Khulna	117.8

	National	42.1	National	63.7	National	80.5

District performance

Figure 6 shows the top performer among 64 districts in terms of performance of long-acting methods.

In last two years, Rajbari achieved the highest performance in permanent method among all 64 districts. Earlier in 2017, permanent method performance was the highest in Joypurhat.

IUD performance data reveals three different districts in three years. In 2017, the highest performance in IUD distribution was observed in Chattogram among 64 districts. The following year witnessed Khulna as the top performing district in IUD and Rajbari district reported the same in 2019.

In 2017, Cox's Bazar reported the highest performance in implant among 64 districts. Bandarban was the top performer in 2018 and Rajbari in 2019.

Rajbari is the only district in the country which performed the best in all three long acting methods in 2019. Earlier in 2018, Rajbari was also credited for the highest performance in permanent method.

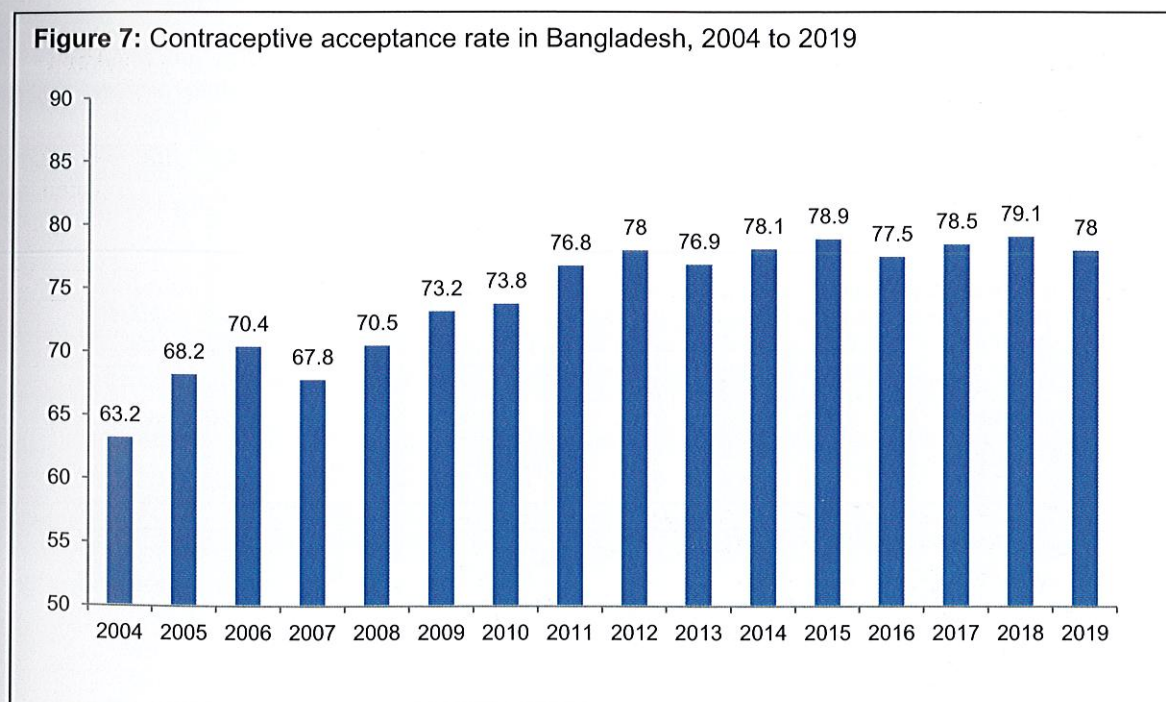

Contraceptive acceptance rate (CAR)

Contraceptive Acceptance Rate (CAR) is an ongoing up-to-date rate which is principally used to monitor field service performance of seven modern methods of contraception (pill, condom, injectable, IUD, implant, male sterilization, and female sterilization) provided under the national family planning program of Bangladesh. CAR estimate is prepared monthly on the basis of service statistics sent by field functionaries. The base information is gathered from married women of reproductive age in the Family Welfare Assistant (FWA) register during door-to-door visitation by the fieldworkers. CAR primarily compiles information from the eligible couples from rural areas. A small proportion of urban couples (from the catchment of NGO clinics) are included in CAR. The number of contraceptive acceptors is always cumulative. Every month's figure shows the total acceptors and acceptance rate up to next month. The DGFP MIS has a well-established system to generate contraceptive acceptance estimates at each level—from FP unit at the community level to the national level.

National CAR performance

Figure 7 presents the CAR over the last 15 years to understand the acceptance rate of modern family planning methods among ELCOs in Bangladesh. It is important to note that regular data collection activity was hampered during the organizational change that took place under the Health and Population Sector Program (HPSP) 1998-2003.

The period from 2004 to 2019 witnessed a gradual increase in the acceptance rate of modern family planning methods, except the year 2007, 2013, 2016 and 2019. The CAR increased 11 percentage points in six years, from 63 percent in 2004 to 74 percent in 2010. The rate reached its peak at 79 percent in 2015. Between 2012 and 2019, the rate remained almost at the same level, at 78-79 percent. The national CAR declined slightly from 79 percent in 2018 to 78 percent in 2019.

Divisional CAR performance

While the national CAR performance remains almost at the same level (78-79%) in last three years, the rate varies at the divisional level. Overall, the CAR differences across divisions are small. The CAR performance was found to be highest among the divisions from the western region of the country in all three years. The top three divisions are from the west. The highest CAR is observed in Rajshahi, followed by Khulna and Rangpur divisions. Chattogram division was found to report the lowest CAR in the country and Dhaka was in the second lowest position. The CAR gap between top and bottom performing districts lies between 5-6 percentage points.

Figure 8: Contraceptive acceptance rate (CAR) by divisions, Bangladesh, 2017-19

District CAR performance

The distribution of 10 high performing districts in terms of contraceptive acceptance rate reveals the supremacy of districts from the western region of the country. Eight of the 10 high performing districts are located in the western region of the country and the pattern holds true for all three years. These are: Joypurhat, Bogura, Natore and Rajshahi districts from Rajshahi division, Chuadanga and Bagerhat districts from Khulna division, and Nilphamari, Panchgarh or Dinajpur (a combination of 2 districts each year) from Rangpur division. Joypurhat achieved the highest performance in CAR in the country in three consecutive years.

Apart from the eight high performing districts from the western region, a total of three districts from the eastern and middle regions belonged to the top-10 group during in three years. In 2017 and 2018, Rangamati district from Chattogram division and Bhola from Barishal division belonged to the top-10 group, and Rangamati and Bandarban districts from Chattogram division were found to be two non-west districts in the top-10 group in 2019 (Table 12).

Table 12: High performing ten districts in terms of contraceptive acceptance rate (CAR), Bangladesh, 2017-2019 (Descending order)

Rank	2017		2018		2019	
	District	CAR (%)	District	CAR (%)	District	CAR (%)
1	Joypurhat	84.2	Joypurhat	84.6	Joypurhat	83.7
2	Rangamati	83.6	Chuadanga	83.9	Bogra	82.8
3	Chuadanga	83.4	Rangamati	83.6	Bandarban	82.6
4	Bogra	83.0	Bogra	83.4	Natore	82.2
5	Natore	82.8	Natore	82.8	Rangamati	82.0
6	Rajshahi	82.4	Rajshahi	82.6	Dinajpur	81.7
7	Nilphamari	81.6	Bagerhat	82.3	Chuadanga	81.4
8	Bagerhat	81.5	Panchgarh	82.1	Rajshahi	81.4
9	Bhola	81.4	Bhola	82.1	Bagerhat	81.0
10	Panchgarh	81.2	Dinajpur	81.7	Nilphamari	81.0

Figure 9 shows the highest and lowest performing district in terms of contraceptive acceptance rate for the last three years. Joypurhat district has been consistent in earning the top position in CAR performance in three consecutive years while Feni was found to be the lowest performing district during the same period. It is encouraging to note that the difference between the two extreme levels of acceptance is slowly narrowing over the years. The top-bottom CAR difference was found to be 14 percentage points in 2017, which decreased to 13 percentage points in 2018 and 12 percentage points in 2019.

Figure 9: Highest and lowest performing district in terms of contraceptive acceptance rate (CAR), Bangladesh, 2017-19

Total fertility rate

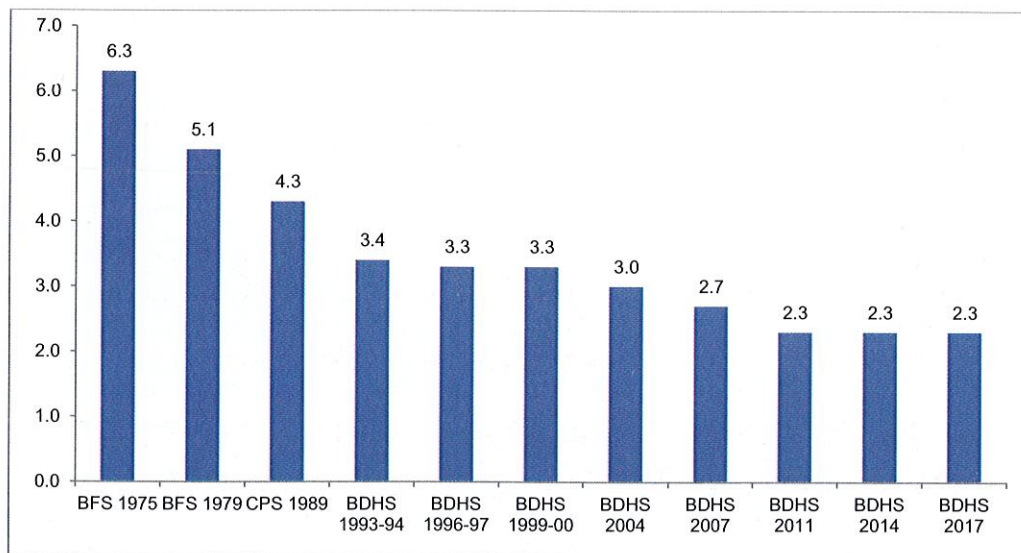

Fertility is one of the three principal components of population dynamics that determine the size, structure, and composition of the population in any country. The total fertility rate (TFR) is the average number of children women would have by the end of their childbearing years if they survive all years and subject to the fertility rates of a given period. It is expressed as children per woman.

National fertility rate

The TFR reported by eight Bangladesh Demographic and Health Surveys (BDHSs) since 1993-1994 and the three preceding surveys carried out since 1975 are presented in Figure 10. The data indicate that fertility in Bangladesh has been declining since the mid-1970s. The TFR declined sharply from 6.3 births per woman in 1975 to 4.3 births per woman in 1989, followed by another rapid decline in the next decade of 1.0 birth per woman to reach 3.3 births per woman in 1996-97.

Following a decade-long plateau in fertility at around 3.3 births per woman, the TFR declined further by one child to reach 2.3 births per woman in 2011. There has been no decline in the fertility rate since then. According to BDHS 2017, the current TFR is 2.3, the same as in the 2011 BDHS.

Figure 10: Total fertility rate in Bangladesh, 1975-2017

Divisional fertility rate

There is an east-west divide in terms of TFR. The TFR differences between divisions are more pronounced. According to 2017 BDHS, Khulna division has the lowest TFR (1.9 births per woman), and Sylhet division has the highest TFR (2.6 births per woman) followed by Chattogram (2.5 births per woman). Khulna division with 1.9 births per woman has achieved the fertility level target of 2.0 births per woman, while Rajshahi and Rangpur with 2.1 births per woman each are very proximate to achieving the target.

Between 2011 and 2017 BDHS, fertility remained the same at the national level while some changes in TFR were observed at the divisional level. During this period, the fertility has slightly declined in two divisions (Chattogram and Sylhet), remained the same in three divisions (Khulna, Rajshahi and Rangpur) and slightly increased in Dhaka and Barishal division (Figure 11). A notable decline in fertility was observed in Sylhet division, from 3.1 in 2011 to 2.6 in 2017. Since Dhaka is by far the largest division—comprising one-third of Bangladesh’s population—the fertility rate of this division has a large impact on the national fertility rate.

Figure 11: Total fertility rate by divisions, Bangladesh, 2011-2017

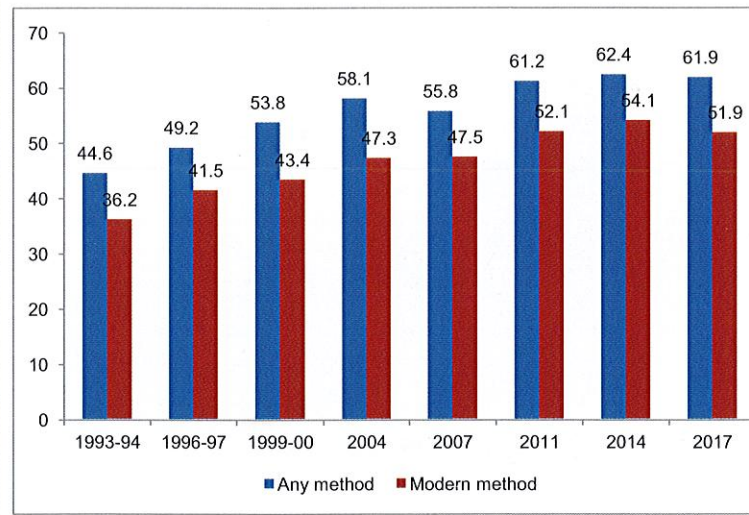

Contraceptive prevalence rate (CPR)

Use of contraception among married women in Bangladesh has increased gradually, from 45 percent in 1993-94 to 62 percent in 2017. Between 2004 and 2017, use of contraception increased by only 4 percentage points, from 58 to 62 percent. In contrast, the use increased 13 percentage points, from 45 in 1994 to 58 percent in 2004.

While 62 percent of married women use any FP methods, some 52 percent use a modern method. Between 2007 and 2017, contraceptive use has increased by 6 percentage points from 56 percent in 2007 to 62 percent in 2017, while use of modern contraceptive methods increased by 4 percentage points from 48 percent to 52 percent during the same period. Between 2014 and 2017, there has been no increase in contraceptive use while use of modern methods decreased by 2 percentage points (Figure 12).

Figure 12: Use of family planning methods, Bangladesh, 1993-2017

Contraceptive method mix based on CPR, 1993-2017

There has been no change in contraceptive method mix over the past two decades. But, this period has witnessed changes in method-wise performance. Overall, the users of modern FP methods increased to 52 percent from 36 percent during this period, and this increase was solely contributed by the increase in the use of short-acting methods. The short-acting method users increased by 18 percentage points, from 25 percent in 1993-94 to 43 percent in 2017. The permanent method users decreased by three percentage points, from nine percent in 1993-94 to six percent in 2017.

Table 13: Contraceptive method mix in Bangladesh, 1993-2017

FP Method	1993-94	1996-97	1999-00	2004	2007	2011	2014	2017
Any method	44.6	49.2	53.8	58.1	55.8	61.2	62.4	61.9
Modern method	36.2	41.5	43.4	47.3	47.5	52.1	54.1	51.9
Traditional method	8.4	7.7	10.3	10.8	8.3	9.2	8.4	10.0
Short acting method								
Oral pill	17.4	20.8	23.0	26.2	28.5	27.2	27.0	25.4
Condom	3.0	3.9	4.3	4.2	4.5	5.5	6.4	7.2
Injectable	4.5	6.2	7.2	9.7	7.0	11.2	12.4	10.7
Long acting and permanent method								
IUD	2.2	1.8	1.2	0.6	0.9	0.7	0.6	0.6
Implant	-	0.1	0.5	0.8	0.7	1.1	1.7	2.1
Female sterilization	8.1	7.6	6.7	5.2	5.0	5.0	4.6	4.8
Male sterilization	1.1	1.1	0.5	0.6	0.7	1.2	1.2	1.1

The pill is by far the most widely used method (25%), followed by injectable (11%). Currently, condom is the least popular among three short acting methods, accounting for only seven percent share of all use. The three short acting methods jointly represent 43 percent of currently married couples who use any FP methods. Nearly nine percent of currently married couples use a long-acting method, such as an IUD, implant, or a permanent method.

Contraceptive method mix based on CAR, 2017-2019

The contraceptive method mix based on CAR for the period of 2017-19 is shown in Figure 13. Pill constitutes nearly half of all contraceptive acceptance, followed by injectable accounting for 20 percent share of total acceptance. Another 13 percent acceptors comes from permanent method. The share of IUD among all method acceptors is the lowest, representing only three percent of total acceptance. The rate of acceptance for specific method remains the same over the last three years.

Figure 13: Contraceptive method mix based on CAR, 2017-19

CAR-CPR difference

The Directorate General of Family Planning uses CAR to monitor the program performance of modern methods of contraception. The CAR estimate is primarily built upon the apparent acceptor of a method. It is not a precise rate as CPR estimate, which is based upon scientifically formulated study methodology.

CAR is a tentative rate and varies from year to year due to coverage and reporting status. It is based on the client contact and the status of contraceptive acceptance as reported by the field workers in the FWA register. This is generally higher than the CPR. However, CAR, as a monitoring tool, is used to understand on-going program performance in the country not for program evaluation. The CPR, on the other hand, is used for program evaluation. The CPR is based on periodic surveys that are made on

precise statistical procedures. The source of data required to calculate the CPR is a population-based survey, such as the Demographic and Health Survey (DHS), Multiple Indicator Cluster Survey (MICS), and other national surveys. Such survey is conducted once in 3-4 years and its samples are not adequately large to ascertain community-level CPR.

A comparison between DGFP's MIS-generated CAR and BDHS-estimated CPR reveals a higher rate for the former. For example, the BDHS 2017 shows a modern CPR of 52 percent while the MIS shows a CAR of 78 percent. A 26 percentage points gap between modern CPR and CAR is worth investigating. A close relationship can be developed by calculating error margin between CAR and CPR estimates.

Sources of FP methods

The distribution of family planning methods are classified into two major categories: public-sector sources, and NGO and multi-sector sources. The distribution of modern family planning methods by public and NGO sectors for the period of 2011-19 is presented in Figure 14 and 15.

The government sector remains the pre-dominant provider of contraceptive methods, catering to a more than three quarters of users for all modern FP methods. The NGO sector provides contraceptives to less than 20 percent of all users of modern FP methods except condom. The distribution of modern contraceptive methods varies by the specific method.

As shown in Figure 14, the contribution of government sector in providing pill and injectable is 83 and 77 percent respectively, and the share has not increased in the last three years. Between 2017 and 2019, the contribution of the public sector in condom has increased 8 percentage points, from 68 to 76 percent. The NGO-sector contribution in pill and injectable was 23 and 17 percent respectively and the share remained the same during the reference period, while the provision by the NGO sector in condom declined notably.

Figure 14: Distribution of short acting methods by supply sources, Bangladesh, 2017-19

Figure 15 shows an increase in the government sector contribution in the long-acting and permanent methods over time. The government sector share in providing permanent method increased from 78 percent in 2017 to 81 percent in 2019. The government sector contributed 89 percent implant distribution in 2019, which was 85 percent in 2017. Similarly, the government contribution in IUD has increased 5 percentage points, from 80 to 85 percent in the last three years. Conversely, the NGO-sector supply of contraceptives decreased for all the long-acting methods.

Figure 15: Distribution of long acting and permanent methods by supply sources, Bangladesh, 2017-19

Post-Partum Family Planning (PPFP)

Figure 16 shows the percent distribution of Post-Partum Family Planning (PPFP) method acceptors for the period of January- December 2019. The collection and compilation of PPFP performance for all modern family planning methods started in January 2019.

The percent distribution of women who adopted any modern FP method at post partum in 2019 reveals that the majority adopted pill at post partum, accounting for 53 percent of all PPFP use. Another 17 percent of PPFP acceptors adopted injectable, which emerges as the second most popular method among PPFP clients. The condom acceptance was estimated to be 15 percent of all PPFP acceptance. Among long acting and permanent methods, the share of implant is the highest at seven percent of all PPFP use followed by female sterilization with a six percent share (Figure 16).

Figure 16: PPFP method mix, 2019

The total number of PPFP method acceptors in December 2019 was 1,002,731, which represents almost four percent of ELCOs. The total number of PPFP pill users was 527,626. Another 166,806 women adopted injectable at post partum. The condom acceptance among PPFP clients was estimated to be 145,271. A total of 163,028 PPFP clients adopted a long acting or a permanent method as of December 2019.

Table 14: Month wise post-partum family planning method acceptors, January-December 2019

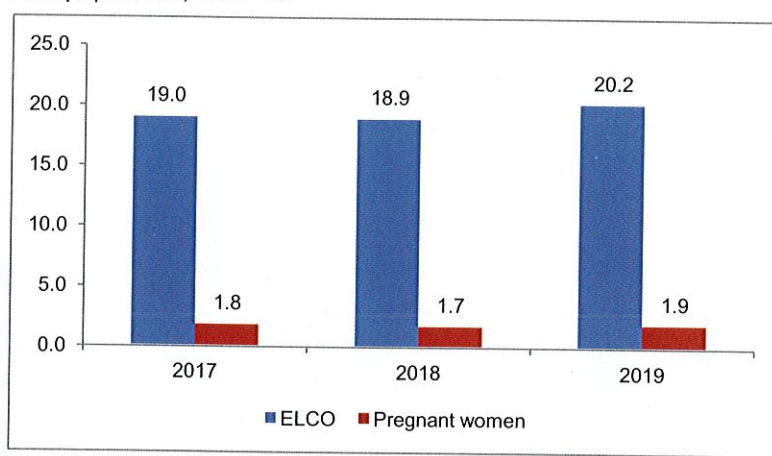

Month	Total						Male sterilization	Female sterilization	Total PFP acceptors
	ELCOs	Oral Pill	Condom	Injectable	IUD	Implant

VIII. MATERNAL AND CHILD HEALTH SERVICES

Eligible couples and pregnancy

Figure 17 shows the percentage of ELCO and pregnant women of total population for the period of 2017-19. In 2019, ELCOs constituted 20 percent of the total population, which was one percentage point higher than previous two years. The pregnant women comprised two percent of the total population in the country. The pregnant women as share of the total population slightly increased in 2019 compared to the previous years.

Figure 17: Percentage of eligible couples and pregnant women of total population, 2017-19

Antenatal care services

Figure 18 presents information on the number of antenatal care (ANC) visits for the most recent live birth in the last three years. In 2017, the number of women who made four or more ANC visits during their pregnancy was 1,256,874. More women made four or more antenatal visits in 2018 than in 2017 and 2019. The number of women who made at least one antenatal care visit was reported to be 2,048,079 which peaked in 2018 registering 2,158,859 and then decreased in 2019. This trend has hardly changed for women who made two or three ANC visits. The number of antenatal care services for all visits (ANC 1 to 4) was the highest in 2018, while a decrease in ANC uptake was reported in 2019 for all visits.

Figure 18: Number of antenatal care services reported by FP service providers, 2017-19

Institutional delivery services

Figure 19 presents the distribution of facility-based deliveries by type of delivery. DGFP service providers reported these deliveries from respective service areas in the country. Information is shown against deliveries performed at MCHTI, MFSTC, MCWCs, UHCs and UHFWCs.

At the facilities, the number of women who gave birth by C-section is lower than those women who had a vaginal birth. An increase in both normal and C-section deliveries was reported. The total number of institutional deliveries reported in 2017 was 699,435. There was an increase in number of institutional deliveries in the three years, climbing to a total of 853,555 in 2019. The number institutional deliveries reported in 2018 was the lowest, totaling 682,287 (Figure 19), which is in stark contrast with ANC uptake.

Figure 19: Number of facility-based normal and cesarean deliveries reported by FP service providers, 2017-19

Postnatal care services

Figure 20 presents information on the number of postnatal care (PNC) visits for the most recent live birth in the last three years. Health check-ups of both post-partum mother and newborn were calculated as PNC services. In 2017, the number of women who made four or more PNC visits was 712,476, which increased to 808,748 in 2018. The practice of receiving four or more PNC visits was lowest in 2019. The number of women who made four PNC visits is the highest compared to other women who made less number of visits. It is the least common among women to have two PNC visits.

In aggregate, more women made any PNC visits in 2018 than in 2017 and 2019, the same as ANC uptake.

Figure 20: Number of postnatal care services reported by FP service providers, 2017-19

Births reported by FP workers

The period of 2017-19 witnessed a gradual decrease in the number of births at home for both trained and untrained service providers. Both live births and still births were calculated as total births at home. The total number of births delivered at home by trained providers is greater than those by untrained providers in the last three years. In 2019, the total number of births delivered at home by trained providers reported was 472,221, which is about three times of births delivered at home by untrained providers (146,121).

Figure 21: Number of births at home by type of providers, 2017-19

Still births reported by FP workers

As shown in Figure 22, the percentage of still births among all births was higher in 2019 compared with the previous years. The rate of still births varies by divisions. Overall, Sylhet division reported the highest likelihood of still births among all births in 2017 and 2018 while Rangpur had the lowest rate over the three-year period. In 2019, the rate of still births was the highest in Barishal, where eight out of every 1,000 births were still births, followed by Sylhet division with seven still births among 1,000 births. In the last three years, the rate of still births decreased notably in Sylhet division, increased in Rajshahi, Barishal and Chattogram divisions, and remained the same in Dhaka and Rangpur divisions.

Figure 22: Percentage of still births of total births reported by FP providers, 2017-19

Infant deaths reported by FP workers

Figure 23 shows the proportion of deaths among infants by the time of death. Three quarters of deaths took place in the first 28 days of life after birth (i.e., neonatal death), whereas other one quarter took place in subsequent 11 months (post-neonatal death). The share of neonatal death among all infant deaths decreased two percentage points in the last three years.

Figure 23: Percent distribution of infant deaths, by time of death, 2017-19

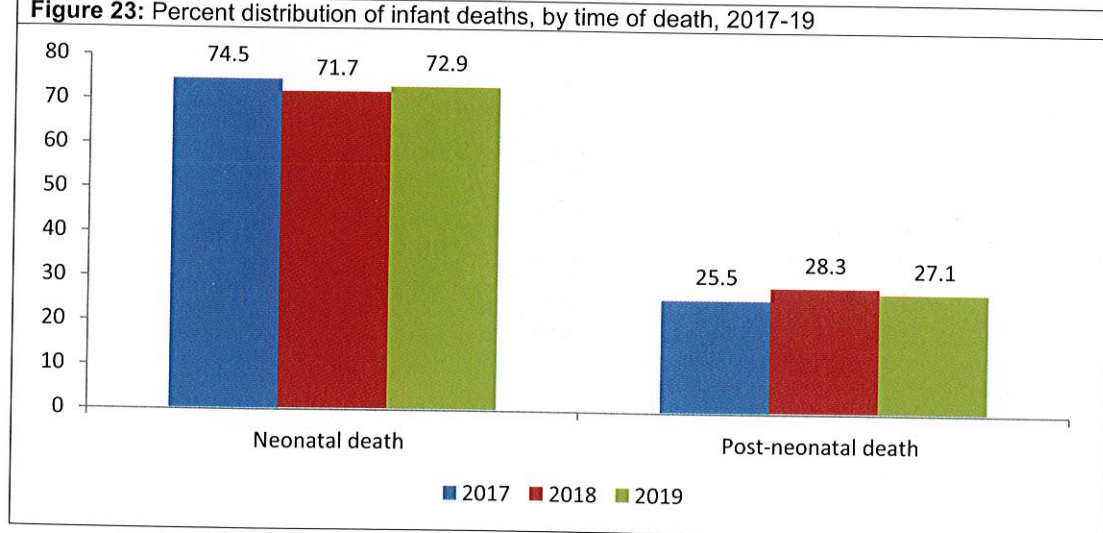

Table 15 shows the division-wise death related information for the year 2019. The total number of infant death is 6,152, and of them 4,486 took place within 28 days of life. Sylhet division had the highest number of neonatal deaths and Chattogram division had the highest number post-neonatal death (between 29 and 365 days of life). The total death among child age 1-5 years is 1,167 and Chattogram division has higher share than the other divisions. The total number of maternal death is 1,104. Chattogram division was found to have the highest number of maternal deaths (n=233) among all divisions, followed by Sylhet division with 182 maternal deaths.

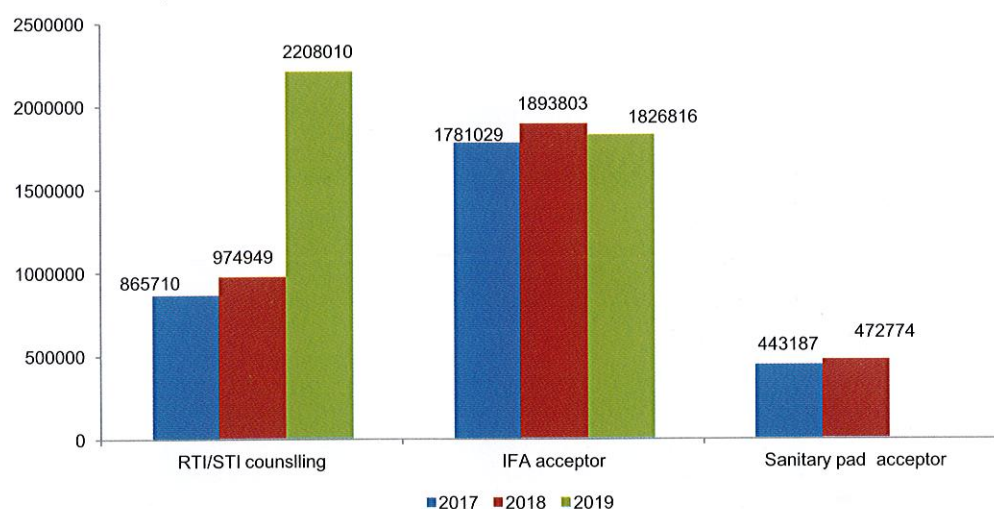

Table 15: Division-wise number of deaths reported by FP Workers, 2019

Division	No. of infant deaths			No. of child deaths 1-<5 years	Number of maternal death	Other death	Total death
	0-28 days	29 days to <1 year	Total				
Rangpur	610	234	844	158	141	29,348	30,478
Rajshahi	494	174	668	88	140	42,893	43,789
Khulna	492	194	686	122	91	36,333	37,231
Barishal	465	86	551	107	92	20,069	20,819
Dhaka	659	241	900	127	129	53,898	55,054
Chattogram	683	350	1,033	353	233	58,237	59,865
Sylhet	806	280	1,086	127	182	17,843	19,237
Mymensingh	277	107	384	85	96	21,425	21,990
Total	4,486	1,666	6,152	1,167	1,104	280,046	288,463

IX. ADOLESCENT SERVICES

Counseling services on adolescent reproductive health by family planning workers increased more than two folds in the last three years. The number of adolescents who received counseling on RTI/STI from FP workers was 2,208,010 in 2019 compared to 865,710 in 2017.

Figure 24 shows a gradual increase in the distribution of iron and folic acid (IFA) tablet and sanitary pad among adolescent girls over the three years. In 2019, the number of adolescents who received IFA tablet was 1,826,816. In 2018, the number of adolescents who received sanitary pads from FP workers was 472,774.

Figure 24: Number of adolescents who received counseling on RTI/STI, IFA tablet and sanitary pad from FP service providers, 2017-19

X. NUTRITIONAL SERVICES

The DGFP provides maternal and young child nutrition services. The DGFP MIS collects information on nutrition indicators which include:

- counseling to mothers on infant and young child feeding (IYCF), IFA, vitamin-A, and hand-washing
- Exclusive breastfeeding practice
- Feeding vitamin-A tablet

Counseling services by family planning workers increased substantially in 2019. The number of counseling services to mothers on IYCF, IFA, vitamin-A and hand-washing increased more than four

times in the past three years, from 1,686,054 in 2017 to 7,537,839 in 2019. A gradual increase in the practice of breastfeeding was observed in the last three years and the number of women who reported exclusive breastfeeding was 1,850,674 in 2019. Vitamin-A tablet feeding decreased in the last three years (Figure 25).

Figure 25: Counseling on maternal and newborn nutrition practices, 2017-19

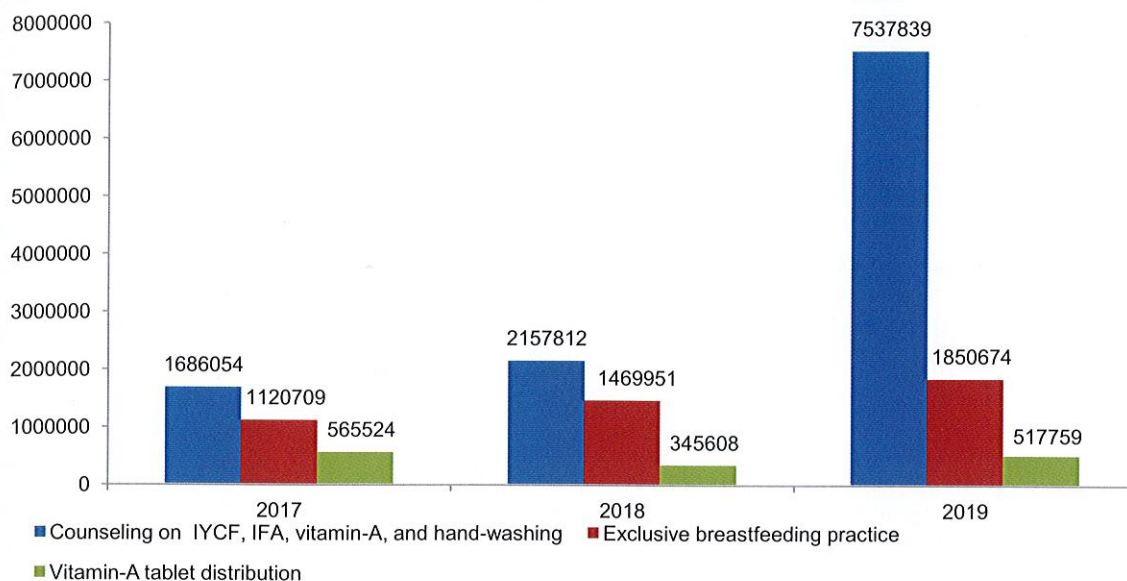

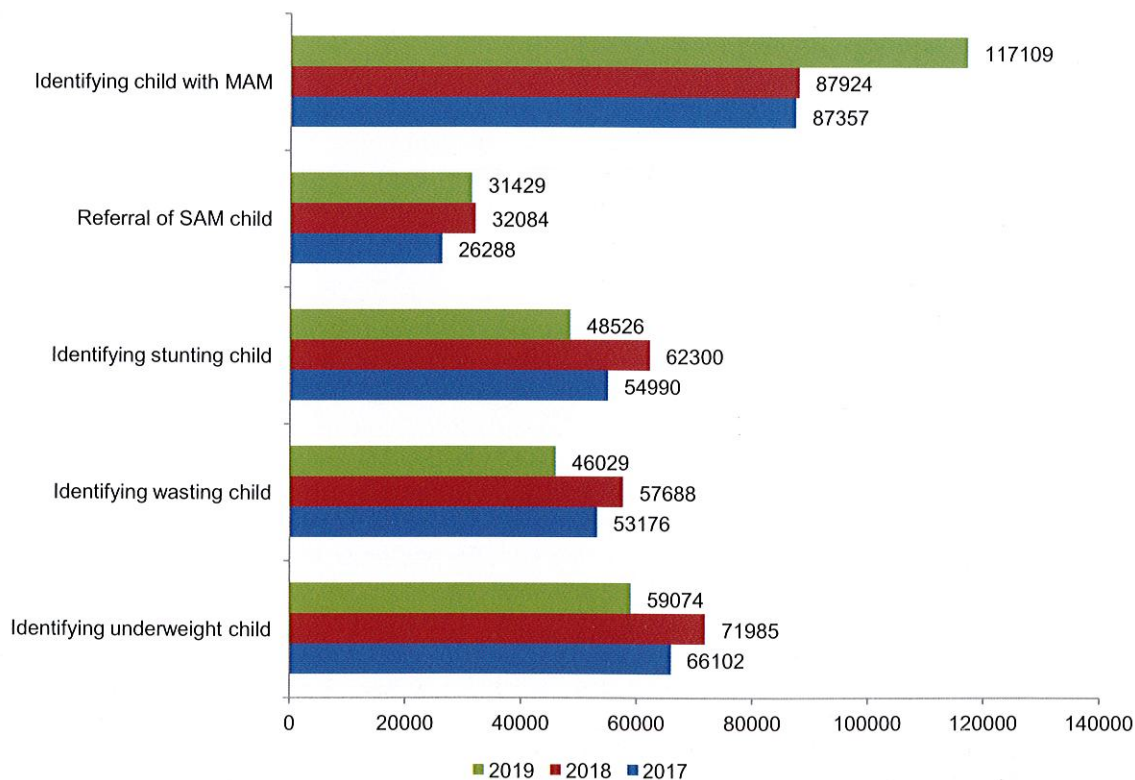

Figure 26 shows an increase in the identification of underweight, wasting and stunting cases in 2018 compared to other two years. Similarly, the number of referral for severe acute malnutrition (SAM) was higher in 2018 than in 2017 and 2019. The number of children identified as medium acute malnourished (MAM) increased notably in 2019 compared to the previous years.

Figure 26: Identification of malnourished children and referral, 2017-19

XI. CHALLENGES OF FAMILY PLANNING PROGRAM

In Bangladesh, family planning remains one of the top priorities in the Fourth Health Sector Program 2017-2022, as a path toward achieving the SDGs. Several areas require further attention to ensure effective family planning in the future:

- a) **Low use of long acting and permanent methods of contraception.** Only nine percent of currently married women use a long acting or a permanent method to limit fertility. It is a cause for concern in the context of greater demand for limiting fertility as two-thirds of currently married women of reproductive age do not want an additional child. To increase the use of long acting and permanent methods, it is of high importance to intensify program efforts to reach the women who have two children or more and are using short acting methods.
- b) **Low use of contraception among young married females:**
Use of contraception among young married females age 15-19 is 49 percent which is lower than the national average of 62 percent. Moreover, women age 15-19 have the highest unmet need at 17 percent compared with overall 12 percent unmet need for family planning.
- c) **Low participation of male in contraception:**
Male participation in contraception is significantly low compared to female participation in contraception. According to BDHS 2017 report, male share in total method use is only eight percent, which is contributed by male sterilization and condom with 1.1 percent and 7.2 percent respectively.
- d) **High maternal mortality:**
By 2030, Bangladesh is committed to bring down the maternal mortality ratio to 70 per 100,000 live births from the current level of 170 per 100,000 live births. The country needs to increase the rate of skilled delivery to 100 percent by 2030. According to BDHS 2017, medically trained personnel attended 53 percent of deliveries. By 2022, the 4th sector plan objective is for 65 percent of deliveries to be attended by medically trained personnel.
- e) **High child mortality:**
Bangladesh is expected to reach the global target of 25 or fewer deaths per 1,000 child births in years by 2030. Despite great strides in achieving the target of Millennium Development Goal in reducing under-five mortality, the reduction in neonatal mortality remains a challenge. Currently, the neonatal mortality rate is 30 deaths per 1,000 live births, accounting for 67 percent of all under-five deaths.
- f) **Regional variations in TFR and CPR:**
In Bangladesh, regional variation in fertility is marked by an east-west divide. TFR is the highest in the eastern region of the country. Sylhet division has the highest TFR (2.6 births per woman) followed by Chattogram (2.5 births per woman) while Khulna has the lowest TFR (1.9 births per woman) closely followed by Rajshahi and Rangpur divisions. Use of contraception is the lowest in the eastern region of the country. Sylhet and Chattogram division were found to be the lowest performer in terms of CPR. Such regional variations continue to dampen the overall program effectiveness. Moreover, Dhaka is by far the largest division, comprising one-third of country's population, and the fertility rate of this division has large impact on the national fertility rate.
- g) **Asymmetric fieldworker and couple ratio:**
In the early 1980s, the DGFP assigned each FWA to visit a family planning unit of approximately 600 households every two months. With the increase in women of reproductive age in the last four decades, the number of households requiring support from each FWA more than doubled. Currently, FWA and couple ratio stands to 1: 1200-1500 which poses serious challenge to cover all the eligible couples under

family planning service. Moreover, accuracy and validity in couple registration are seriously compromised due to the shortage of FWAs.

- h) **Data driven challenges:** The validity and reliability of field data remain a critical challenge for MIS unit. A routine data quality auditing system to detect reporting errors and to instantly identify weaknesses in the data management system is found useful for estimating CAR more accurately. In addition, sample survey can be adopted to compare the validity of CAR and other relevant data. Besides, the projection setting procedure should consider demographic facts and trends.
- i) **Adolescent Fertility Rate:** Higher adolescent fertility is a major challenge of the program. Age at first marriage among women age 20–49 increased to 16.3 years in 2017. Married women aged 20 years or below are least likely to use any FP method compared with other age groups. Government has taken all-out effort to lessen the child marriage rate of the country. Special focus should be given to the couple of adolescent age.
- j) **Contraceptive Dropout:** Thirty-seven percent of users of a contraceptive method stop using the method within 12 months of starting (BDHS 2017). As expected, discontinuation rates are much higher for temporary methods like condoms (45%), pills (42%), and injectables (34%) than for long-term methods like implants (11%). It is important to address the issue of contraceptive discontinuation.
- k) **Unmet Need of Contraceptives:** Unwanted births not only pose risk to child health and wellbeing but also force to rapid population growth. Huge number of unsafe abortions take place each year, contributing to high rates of maternal death and injury in Bangladesh. The program should intensify its efforts in the rural areas of the country in order to enhance accessibility to, and availability of, family planning methods. Young married women (less than 20 years of age) deserve special consideration because unmet need is highest among them, and their fertility is high. The program should attach high priority to addressing the needs of these women by appropriate IEC measures and selective home visits.

ANNEXURE 1

Annex 1.1 Innovation, Recognition, and Staff Motivation, 2017-19

Dr Md Ilias, Deputy Director
District Family Planning Office, Chandpur

Online monitoring software on “Maternal and Child Service Management” – A milestone step

Under the guidance of district administration, the District Family Planning Office, Chandpur launched this innovative and timely activity with a view to ensuring safe motherhood and reducing maternal and child death. Historically, family planning office is heavily involved with providing different methods and imparting maternal and child health services. The District Family Planning Office, Chandpur has introduced a software, www.pregnantmothercare.gov.bd, for ensuring efficient and quick maternal and child health care services using digital technology.

The initiative started in June 2017 at ‘Laxmipur Model Union’ of Chandpur Sadar Upazila as a pilot project. After successful piloting, this innovative approach was scaled up to other 8 upazilas (one union from each upazila). Afterwards, the software was upgraded and expanded as ‘Mother and Child Service Management’. Now, this digital service management is being successfully implemented at 10 unions from 8 upazilas.

The ‘Mother and Child Service Management’ software collects information of pregnant mothers and other relevant information including number of children, last menstrual period (LMP), expected date of delivery (EDD), and pregnancy history of any complications. During information collection, service provider provides necessary information on institutional delivery and associated services and then uploads relevant data into the software using smart phone. In the following months, pregnant mother is regularly followed-up either by direct visit or via mobile phones, so that four basic antenatal care is ensured. Then service providers follow up the registered pregnant mothers from delivery care to postnatal care. Uploaded all information, shown in different color codes, is closely monitored by the Deputy Director, Family Planning and the District Commissioner of Chandpur.

Impact:

- After the introduction of digital technology, maternal and child health care service has become much more efficient and quicker, thereby, a full cycle of maternal health care services have been ensured. Moreover, rate of neonatal mortality has been reduced from 18 to 11 and maternal mortality from 169 to 124 in the project area, which is contributing to achieving SDG goal.
- Use of digital technology among officers and staff has added a new dimension at the field level. Field-level workers now successfully use and utilize digital devices, such as tabs and smart phones. Such technological absorption by staff and officials have brought about significant skill upgradation in imparting quick and quality health care.

Award and recognition

- This innovative approach has been awarded as ‘Public Administration Award 2019’ in group category for ensuring safe motherhood and reducing maternal and child deaths through the use of digital technology’. Apart from this, this activity has placed in 1st position in innovation category at the Digital Innovation Fair 2018.

Annex 1.2 Chonua Model

Iftekhhar Ahmed Chowdhury

Family Planning Officer, Feni Sadar

Iftekhhar Ahmed Chowdhury started the concept of Chonua model under the supervision of the then District Commissioner.

Objectives and priorities:

The objectives of this model are to establish a planned family, ensure safe motherhood, reduce maternal and child mortality, and prevent child marriage. Besides, the core purpose of this model is to use existing government facilities, seek assistance from local level and utilize information technology in order to make the model union as a successful health service centre in accordance with the philosophy of building digital Bangladesh and vision 2021.

Specific objectives:

- Ensuring 100% utilization of FP services
- Ensuring 100% ANC coverage, at least 60% skilled delivery and PNC service
- Ensuring vaccination to all children through EPI
- Building awareness on nutrition among children
- Building awareness on the utilization of information technology to receive health and FP services

Innovative steps in Chonua model:

- No special government fund or allocation is used for this purpose. Success of this centre depends on existing resources, manpower and regular allocation of fund.
- Apart from FP department, local district and upazila administration and its affiliated offices collaborated to achieve its goal. Moreover, local UP chairman played pivotal role in implementation of the project.
- Spreading awareness program in educational institutions and participation of teachers and students have been ensured.
- In order to bring sustainability of the project, Family Welfare Mother's Club (*Matri Sangha*) has been established at nine wards of the union. Here, club members not only receive FP and MCH services but also receive specialized training for their self employment.

Achievements and awards:

- Chonua model helps to bring down TFR from 2.65 to 2.12 and NRR from 1.7 to 1.68 in the respective union.
- At present, institutional delivery rises to 60% and skilled personnel delivery at home 19%; totaling 79% safe delivery. Before initiating of this project, the rate of safe delivery was only 35%.
- Child marriage has been reduced to zero level.
- Awareness on mother and child nutrition has been increased.
- Gender disparity has been reduced and at least 75% of adolescent boys and girls have received health education on puberty and related issues.

'Chonua model' has earned national recognition and received 'Public Service Award' on group category for its outstanding contribution to health and family welfare services in 2016.

Annex 1.3 Increasing institutional delivery and reducing dropouts of oral pills

Nasima Yasmin

Family Planning Officer, Kustia Sadar

Low number of institutional delivery and high drop-out rates of oral pills have long been a key concern for Nasima Yasmin, Family Planning Officer at Kustia Sadar Upazila.

Challenges:

- Service centers at the union level were not up to the mark
- Knowledge gap among service seekers
- No planning of full cycle of pregnancy and postnatal care
- Client reluctance to seek service from health care facilities and to receive delivery service at the facility.
- High drop-out rates of oral pills

Steps undertaken:

1. Use visuals, e.g. slides to attract *Uthan Boithak* (courtyard meeting)
2. Create database of all pregnant mothers
3. Collect and store mobile phone number of all pregnant mothers
4. Provide necessary information, including addresses of health service centers through phone communication
5. Taking necessary steps to provide quality services

Impact:

- Institutional delivery has increased from 43% to 73% in service area
- Drop-out rates of oral pills have reduced from 33% to 15% in service area
- The number of service recipients has significantly increased in the project area

Awards and Recognition:

'Nasima Yasmin' has received national recognition and was given 'Public Service Award 2017' on individual category for her outstanding contribution to increasing institutional delivery and reducing drop-outs of oral pills.

Annex 1.4 Reflections of a service provider on experience of providing maternal health care services.

Renuka Afroz

Family Welfare Visitor, Mirzanagar Union Health & Family Welfare Centre
Raypura Upazila, Narsingdi District

“I am glad and honored to talk about my job responsibility living in a world of 7 billion people. I, as a health service provider, would say: when a mother receives required ANC, delivery and PNC services and gives birth to a healthy baby, my heart fills with enormous joy. Since my joining at the service, I have been instilled with a self-belief for making significant contribution towards my society as well as the country.

I, Renuka Afroz, have been working as a Family Welfare Visitor at Mirzanagar Union Health and Family Welfare Centre (UHFWC) in Raypura upazila, Narsingdi district for the last 23 years. After receiving an intensive training on maternity and childcare, I started delivering service at the facility. On this long journey, I have served every village, union, satellite clinic and even every house in my locality. While discharging my duties, I very often observed and noticed poor awareness in ANC, delivery and PNC care among pregnant mothers. In addition, there is also considerable knowledge gap on reproductive health among adolescents and modern family planning methods among eligible couples. Noticing ignorance of common people, I started working with firm conviction to raise awareness on health and family planning issues since I joined in this service. During my early period of job, I observed pregnant mothers were reluctant to take service from me; instead they would like to go to unskilled birth attendants. My commitment, determination and motivation, slowly and steadily, have helped me to bring about significant positive change in my community. At present, I provide pregnancy care up to 150-200 women per month and facilitate 50-60 normal delivery at my working station. My long job experience and absorption of various skill sets from departmental training have assisted me to implement my duties and responsibilities more effectively.

Being a skilled health personnel, I provide counseling and service on permanent and long acting methods on family planning, ANC, delivery and PNC, adolescent reproductive health, nutrition, and RTI/STI. In implementing these services, I have received assistance from my local union chairman. Noticing my sincerity and commitment, the chairman of Mirzanagar *union parishad* came forward and provided several medical logistics and infrastructural support to modernize the OT room. He also installed a solar panel to ensure uninterrupted electricity service at the UHFWC. In this regard, I also thank and appreciate Mr. Arafat Hossen, my local manager and upazila family planning officer of Raypura upazila. His constant support and assistance motivated me to move forward with my goal.

Today I am proud that I have been able to gain confidence of local people through sincerity and hard work. However, this journey was not a plain sailing; sometimes I had to endure many bitter experiences and bad words from people. However, through strong will and determination, now I have been able to ensure 100% institutional delivery in my locality and for making a positive impact here. I am very pleased and grateful for my people and community.

ANNEXURE 2

Annex 2.1: District wise Population and other related information in 2017 (Collected by FWAs)

Name of District	Number of Union	Number of Unit	Number of Village	Number of House Hold	Eligible Couple	Population		
						Male	Female	Total
Dinajpur	106	529	2,453	659,163	649,675	1,609,745	1,538,438	3,148,183

MIS is the store of Information of DGFP. In 1979 the MIS Unit was created from the then 'Research, Evaluation, Statistics and Planning' (RESP) under the Directorate General of Family Planning. Prior to the creation of the MIS Unit there was no regular system of reporting on the progress of National Family Planning Program performance. Since its inception the MIS has endeavored towards establishing a regular system of data collection and reporting on National Program Performances of Family Planning, RH & MCH Services. Moreover, DGFP-MIS has introduced a web based MIS System in 2010. In keeping pace with the 'Digital Bangladesh' vision of Honorable Prime Minister, e-MIS, HRIS and DHIS-2 are being implemented for the digitalization of DGFP-MIS.
